Constructing Countervailing Power: Law and Organizing in an Era of Political Inequality

**ABSTRACT.** This Article proposes an innovative approach to remedying the crisis of political inequality: using law to facilitate organizing by the poor and working class, not only as workers, but also as tenants, debtors, welfare beneficiaries, and others. The piece draws on the social-movement literature, and the successes and failures of labor law, to show how law can supplement the deficient regimes of campaign finance and lobbying reform and enable lower-income groups to build organizations capable of countervailing the political power of the wealthy. As such, the Article offers a new direction forward for the public-law literature on political power and political inequality. It also offers critical lessons for government officials, organizers, and advocates seeking to respond to the inequalities made painfully evident by the COVID-19 pandemic.

CONCLUSION 631
INTRODUCTION

Among the painful truths made evident by COVID-19 are the deep inequality of American society and the profound inadequacy of our social-welfare infrastructure. The nation’s lack of comprehensive health care, its underfunded and inefficient system of unemployment insurance, and weak workplace safety and health guarantees, along with nearly nonexistent paid sick leave, debtor-forgiveness rules, and tenant protections leave poor and working-class communities—particularly communities of color—dangerously exposed to the ravages of this pandemic, both physical and economic. America’s weak social safety net is, in turn, a product of a profound failure that has plagued American democracy for decades now: the wealthy exercising vastly disproportionate power over politics and government.

---

8. Even in the midst of the pandemic, as unemployment soared and poor and working-class Americans suffered enormous financial pain, the power of the wealthy was manifest in the relief bills that emerged from Washington. For example, the Coronavirus Aid, Relief, and
Indeed, public faith in American democracy is at near-record lows, and increasing numbers of Americans report that they no longer feel confident in the health of their democratic institutions. When asked why, many say that money has too much of an influence on politics and that politicians are unresponsive to the concerns of regular Americans.\(^9\) Research supports these fears, showing both that wealthy individuals are spending record sums on electoral politics\(^10\) and that elected officials are at best only weakly accountable to nonwealthy constituents.\(^11\)

As political scientist Martin Gilens has observed, “[W]hen preferences between the well-off and the poor diverge, government policy bears absolutely no relationship to the degree of support or opposition among the poor.”

Of course, democracy does not require that policymaking always follow majority will or the median voter’s preferences. But democracy, as well as the faith citizens have in their government, falters when lawmakers persistently disregard the priorities of nonwealthy citizens.

Much of the legal scholarship (and public commentary) concerned with this democracy deficit focuses on the increased flow of money into electoral politics and advocates for stemming that flow. Scholars writing in this vein criticize the Supreme Court’s jurisprudence, exemplified by *Citizens United v. FEC*, that has enabled unfettered campaign spending. They offer a range of reforms designed to limit the flow of money into elections, many of which would require a change in the composition of the Supreme Court or the ratification of a constitutional amendment. A related group of scholars advocates for shielding the legislative and administrative process from money’s influence through, for example, lobbying restrictions and disclosure requirements.

16. See infra notes 134-136 and accompanying text. Lobbying restrictions, too, would be subject to constitutional challenge. See, e.g., United States v. Harriss, 347 U.S. 612, 625 (1954) (stating that “the freedoms guaranteed by the First Amendment — freedom to speak, publish, and petition the Government” are involved in the assessment of lobbying regulation); Autor v. Pritzker, 740 F.3d 176, 182-84 (D.C. Cir. 2014) (emphasizing that registered lobbyists are protected by the First Amendment, and remanding for the district court to consider whether the policy barring government service by registered lobbyists was nonetheless justified).
A second robust body of scholarship focuses not on insulating the political process from money but on trying to ensure equal rights of individuals to participate in the governance process through elections. These scholars criticize barriers to equal voting rights, including contemporary uses of gerrymandering and legislation that impose hurdles on individual voters’ ability to exercise the franchise or minimize the effective voting power of particular constituents.\(^{17}\) Scholars urge both doctrinal and legislative reform that would ensure more equal rights of participation.

In the last few years, a third approach has begun to emerge in the legal scholarship. This approach begins by recognizing the difficulty—both practical and constitutional—of keeping money out of politics. It also recognizes that while equal voting and participation rights are critical to the goal of combatting political inequality, they are not enough to ensure political equality in a system where wealth functions so prominently as an independent source of political influence. Thus, this third approach moves beyond campaign finance and individual participation rights and focuses instead on what we will call countervailing power.

In particular, this approach is concerned with the ability of mass-membership organizations to equalize the political voice of citizens who lack the political influence that comes from wealth.\(^{18}\)

The beneficial effects of countervailing, mass-membership organizations are well known to theorists and researchers of democracy.\(^{19}\) Put simply, such groups increase political equality by building and consolidating political power for the

nonwealthy, thus serving as counterweights to the political influence of the rich. Mass-membership organizations can serve in this capacity because, at bottom, they aggregate the political resources and political power of people who, acting as individuals, are disempowered relative to wealthy individuals and institutions.20 More particularly, mass-membership organizations enable pooling of politically relevant resources, including money, among individuals with few such resources; they provide information to decisionmakers about ordinary citizens’ views; they navigate opaque and fragmented government structures, thereby enabling citizens to monitor government behavior; and they allow citizens to hold decisionmakers accountable. And, in fact, when citizens are organized into mass-membership associations that are active in the political sphere, researchers find an exception to the general rule that policymakers are disproportionally responsive to the preferences and concerns of the wealthy.21

Over recent decades, however, there has been a decline in broad-based, mass-membership organizations of low- and middle-income Americans.22 This decline in countervailing organizations has exacerbated the political distortions caused by the increase in political spending by the wealthy. But the capacity for countervailing organizations to address the distorting effects of wealth raises a critical question for legal scholars: How can law facilitate the construction of countervailing organizations among the nonwealthy? Put differently, how can law facilitate political organizing among Americans whose voices are drowned out by the distorting effects of wealth? That is the question we address in this Article.

Recently, legal scholars have begun to address related topics. For example, K. Sabeel Rahman and Miriam Seifer have written about ways that participation in administrative processes can improve the organizational strength of citizen groups. Thus, Rahman argues for designing administrative processes in ways that enhance the countervailing power of ordinary citizens,23 while Seifer urges administrative-law scholars to pay attention to the characteristics of interest groups participating in the administrative process and to consider “looking

within interest groups,” referencing the manner by which interest groups determine the views of their constituents, “to illuminate the quality and nature of participation in administrative governance.” Tabatha Abu El-Haj has urged greater use of universal benefits and targeted philanthropy, to encourage the growth of mass-membership organizations, since both “create reasons to organize on the part of beneficiaries.” Both of us have written about the countervailing role that labor organizations can play in politics. And Daryl Levinson and one of us have written about the ways in which ordinary public policy often has the effect—and at times the intent—of mobilizing political organization around the policy.

Meanwhile, another group of legal scholars has highlighted the importance of social movements and their organizations in legal change, focusing on how movements shape decisionmaking by courts, legislatures, and administrative agencies. In particular, a rich literature has developed on the relationship between popular mobilization and evolving constitutional principles, and on

how “cause lawyers” can best serve social movements. More recently, there has been a resurgence of scholarship that “cogenerates legal meaning alongside left social movements, their organizing, and their visions.” This work builds on an older tradition of critical legal studies and critical race theory that interrogates the limits of traditional legal rights in bringing about progressive social change given the political, economic, and social conditions that systematically disadvantage poor people and people of color.

To date, however, no one has tackled directly the question that we pose here. Rather than asking how the enactment of substantive legislation or administrative-participation mechanisms might boost organizing, how social

33. In prior work we have each made the case that legal scholars and reformers should pay more attention to “facilitating the participation of countervailing organizations in government,” Andrias, Separations of Wealth, supra note 18, at 495, and have argued that “reforms designed to facilitate political organizing are more likely to avoid the problems of circumvention that have undermined traditional modes of regulation,” Sachs, supra note 18, at 157; see also Andrias, Hollowed-Out Democracy, supra note 18. But the extant analysis—including our own—has been insufficiently informed by careful consideration of where and how law can successfully facilitate and empower mass-membership organizations of nonelites.
movements can or hope to reshape law, or how a focus on traditional legal rights disables fundamental social change, we ask how law could be used explicitly and directly to enable low- and middle-income Americans to build their own social-movement organizations for political power.

The question is particularly urgent today as the COVID-19 pandemic has exacerbated society’s existing inequalities. Working-class communities, especially low- and middle-income people of color, have experienced hardships as a result of the disease to a far greater extent than the wealthy—from massive unemployment to dangerous working conditions, from food insecurity to rising debt and risk of eviction.\[^{34}\] The suffering wrought by the pandemic, as well as by the financial crisis of 2008, has led to an upsurge in protests by low- and middle-income Americans, particularly among workers, tenants, and debtors.\[^{35}\]

At the same time, endemic violence against Black communities, including the recent killing of George Floyd, has led to widespread organizing around issues of racial justice.\[^{36}\] These movements demand that government respond to the

concerns of ordinary Americans and attempt to elicit better treatment from powerful actors. Yet, despite their promise, such movements face significant obstacles in translating their members’ anger into robust and lasting political power.\textsuperscript{37} A pressing task, therefore, is to ask how law can facilitate and protect these new and revived protest movements, helping to create durable organizations that can exercise sustained power in the political economy.

We start from the premise that the robustness of countervailing, mass-membership organizations should be understood as a problem both of and for law. The shape of civil society and organizational life is already a product of legal structures and rules.\textsuperscript{38} And although law has frequently been a tool of oppression, rather than of empowerment, of poor and working-class people and movements,\textsuperscript{39} alternative legal regimes that encourage the growth of and the exercise of power by social-movement organizations of the poor and working class are possible. Indeed, for those who are committed to decreasing political inequality, alternative legal structures that encourage the growth of countervailing organizations are imperative.

In analyzing how legal and institutional reforms could facilitate a different picture of organizational and political life in the United States, we draw from the successes and failures of labor law—the area of U.S. law that most explicitly and directly creates a right to collective organization for working people—while also moving beyond that context to literature considering “how, in what forms, and under what conditions social movements become a force for social and political change.”\textsuperscript{40} We do not attempt to adjudicate priority among factors that

contribute to successful organizing, nor do we attempt to build an exhaustive list of such factors. Instead, we consolidate factors that have two attributes: (1) they are likely to contribute to the successful building of membership organizations among poor and working-class people, and (2) their existence or development might be enabled by law.

We recognize that some factors, undoubtedly critical to successful organizing, are beyond the reach of our proposal. For example, sociologists and historians have demonstrated that several structural opportunities helped facilitate the growth of the Civil Rights movement, including the collapse of cotton; the increase in Black migration and electoral strength; and the advent of World War II and the Cold War. These kinds of objective structural conditions, exogenous to movements themselves, are frequently important to movement formation, but they cannot be directly affected by the kinds of legal reforms we suggest. Likewise, sociologists have shown that strategic leadership within organizations is critical to movement success, but internal leadership dynamics are not easily affected through legal regulation.

Three additional principles guide our analysis. First, because small-scale, concrete victories are essential to successful organizing, and because organizing tends to be most successful among people with shared identities and existing relationships, we focus on reforms that enable organizing within particular structures of authority and resource relations. By way of examples, we consider organizing among workers, tenants, debtors, and recipients of public benefits. We pick these contexts in part because they are ones rife with exploitation and

power imbalances and populated by the relevant income groups, and in part because they are home to important organizing efforts, both historical and contemporary. We do not suggest that these are the only relevant contexts in which our suggestions might be explored, nor do we in any sense imply that broader organizational development encompassing poor and working-class people as a whole is impossible or ineffective. In fact, the context-specific organizing regimes we envision might well facilitate broader community-based and political organization. However, we leave for another day exploration of how the law might directly enable broad-based political organization—say, a political organization of all poor people or a political-party system that incentivizes grassroots participation among nonwealthy individuals.

Second, we focus on how law can build organization, as opposed to more amorphous configurations of insurgency. The organizations our reforms seek to facilitate are very much social-movement actors, in that they seek to change "elements of the social structure and/or reward distribution of a society." But the goal is to encourage enduring organization that can wield sustained,

REV. 245, 269 (2015) ("These movements explicitly use the human right to housing as an organizing framework. . . . These movements define their actions as 'liberating' homes from the shackles of an unjust and immoral housing system that privileges profits over people"); Luke Herrine, The Law and Political Economy of a Student Debt Jubilee, 68 U. 46. John D. McCarthy & Mayer N. Zald, Resource Mobilization and Social Movements: A Partial Theory, 82 AM. J. SOC. 1212, 1217-18 (1977). We refer to the organizations interchangeably as mass-membership organizations and as social-movement organizations (SMOs). Social-sciencescholars broadly define a social movement as a set of opinions and beliefs in a population which represents preferences for changing some elements of the social structure and/or reward distribution of a society. Id.; see also Brown-Nagin, supra note 29, at 1903 (defining social movements as persistent, interactive campaigns that make “sustained, collective claims for relief or redistribution in response to social marginalization, dislocation, change, or crisis” (emphasis omitted)); Guinier & Torres, supra note 28, at 2756-57 (defining social movements).
constructing countervailing power.\textsuperscript{47} Thus, our approach rejects the idea that formal structures facilitated by law are necessarily deradicalizing and inimical to social change.\textsuperscript{48}

Finally, our focus is on how law can facilitate organizations of working-class and poor Americans—not on either of two other questions: one, how law could be designed specifically to enhance the political power of communities of color, or two, how law could encourage the formation of interest groups generally. The first question could not be more critical. Just as our government is disproportionately responsive to the wealthy, it is also disproportionately responsive to white people,\textsuperscript{49} and the crisis of structural racism is perhaps the most acute we face as a nation. As such, a program for building political power among communities of color is just as necessary as a program for building power among workers and the poor. But it is also true that our focus on working and poor Americans ought, in practice, and in part due to the crisis of structural racism itself, to amount to a program for building power among and by communities of color. This is not the exclusive reach of our proposals, and continued attention must be paid to ensure that racial inequities do not infect the political organizing we aspire to enable. But because people of color are over-represented in the sectors of the population that we do address—low-income workers, tenants, government-benefits recipients, debtors—these communities would likely benefit from the success of our proposals. As to the second question, while a more expansive civil society may bring a host of benefits, including greater social cohesion and civic education, this Article’s concern is with building organizations that can serve as a countervailing force to the extraordinary power of economic elites in our political economy.\textsuperscript{50}

\textsuperscript{50} Other work examines the value of robust civil society more broadly. E.g., Robert D. Putnam, Bowling Alone: The Collapse and Revival of American Community (2000); Theda Skocpol, Diminished Democracy: From Membership to Management in American Civil Life (2003).
We argue that a legal regime designed to enable this kind of organizing should have several components. First, the law should grant collective rights in an explicit and direct way so as to create a “frame” that encourages organizing. Second, as importantly, though more prosaically, the law should provide for a reliable, administrable, and sustainable source of financial, informational, human, and other relevant resources. Third, the law should guarantee free spaces—both physical and digital—in which movement organization can occur, free from surveillance or control. Fourth, the law should remove barriers to participation, both by protecting all those involved from retaliation—no worker may be fired, no tenant evicted, no debtor penalized, and no welfare recipient deprived of benefits because they are active in or supportive of the movement’s efforts—and by removing material obstacles that make it difficult for poor and working people to organize. Fifth, the law should provide the organizations with ways to make material change in their members’ lives and should create mechanisms for the exercise of real political and economic power, for example by providing the right to “bargain” with the relevant set of private actors and by facilitating organizational participation in governmental processes. Finally, the law should enable contestation and disruption, offering protections for the right to protest and strike.51

The particulars necessarily vary by context. For example, a law designed to generate organizing among tenants would start by affirmatively granting tenants the right to form and join tenant unions. It would grant such unions the right to access information and landlord property for organizational purposes. It would vest the organization with authority to collect dues payments through deductions from rent payments. It would mandate that landlords negotiate with tenants’ organizations over rent and housing conditions. It would ensure that organizations have special rights of participation in administrative processes related to housing policy. And it would provide for the right of tenants to engage in rent strikes and protests, free from retaliation. A law designed to facilitate organizing among debtors would similarly create a collective frame, provide a mechanism for funding, protect against retaliation, mandate bargaining and

51. Some, though not all, of the interventions we propose might require the state to determine which organizations are entitled to the law’s benefits. For example, if the government directly funds organizations, or requires bargaining with organizations, or mandates access to property for organizations, the law might need to establish criteria according to which organizations qualify (or don’t) for the entitlements in question. Current labor law offers one, quite imperfect model: many legal entitlements (the employers’ bargaining obligation, for example) are granted when, and only when, a union can demonstrate support from a majority of the relevant group of workers. See 29 U.S.C. § 159(a) (2018). This model could be modified so that some threshold showing of support—short of a majority—is required before the organization could avail itself of the relevant legal right. This administrability question is an important one but is beyond the scope of the current Article.
rights of participation in governance, and protect the right to protest and strike, but a debtor-organizing law might not provide for access to physical spaces, instead putting more emphasis on providing information and enabling online organizing.

Some of our proposals will generate resistance—theoretical, legal, and political. And, indeed, we concede that our approach has limitations. For example, we do not attempt to articulate the optimal level of political influence that the organizations in question ought to enjoy, nor a way of measuring when and whether they have become sufficiently strong. As Richard Pildes has written in a related context, we believe it is possible to “identify what is troublingly unfair, unequal, or wrong without a precise standard of what is optimally fair, equal, or right.”52 In addition, the scope of our inquiry is limited to problems of economic inequality. Yet we do not mean in any way to minimize other aspects of inequality, including racial and gender discrimination and hierarchy, which are both inseparable from economic inequality and worthy of separate examination and intervention. To that end, we believe law ought to require inclusion and nondiscrimination among poor and working people’s social-movement organizations.53

Finally, we recognize both that our recommendations will not provide a panacea to the imbalance in power that characterizes our political economy and that our proposals will be difficult to enact. Indeed, although we suggest a range of possible reforms and explain how they could be achieved, the goal is to illuminate law’s constitutive potential and to suggest a path for further work, not to provide a comprehensive blueprint.54 In short, analysis of what makes poor and working people’s social-movement organizations succeed helps show that law

53. Labor law provides a useful example for much in this Article, including the profound risk of racial and gender exclusion. The National Labor Relations Act (NLRA), for example, entrenched and perpetuated certain forms of race- and gender-based oppression by excluding from statutory coverage occupational groups—like domestic workers and agricultural workers—where Black, Latino, and women workers are disproportionately represented. *See* IRA KATZNELSON, *WHEN AFFIRMATIVE ACTION WAS WHITE: AN UNTOLD HISTORY OF RACIAL INEQUALITY IN TWENTIETH-CENTURY AMERICA* 53–61 (2005); *see also infra* note 384 (describing requirements of nondiscrimination, inclusion, and antisubordination that might be imposed on social-movement organizations to prevent internal domination along lines of race, class, and gender).

54. A host of institutional-design questions, specific to particular constituencies and contexts, are thus beyond the scope of this paper.
can make a difference—and that the absence of such law is a choice, one we believe our society cannot afford to make.55

The remainder of this Article proceeds as follows. Part I describes the problem by tracing the relationship between rising economic inequality and the decline of mass-membership organizations, on the one hand, and political responsiveness on the other. It also explains why this form of inequality is a problem, theoretically, for a democratic republic, and describes existing approaches to using law as a mechanism for addressing political inequality. Part II details, at a high level of generality, the promise of legal intervention to encourage organization, drawing on historical and contemporary examples and underlining the extent to which the absence of such regimes is a political choice that favors a particular distribution of power. Part III uses social-science research and lessons from labor law to elaborate the conditions necessary for poor and working-class organizations to thrive and explains how law can facilitate the existence of such conditions in a range of contexts. Finally, in conclusion, we explain why progress toward a law of organizing might be feasible, notwithstanding significant obstacles.

I. INEQUALITY, DEMOCRACY, AND COUNTERVAILING ORGANIZATIONS

A. The Unequal Landscape of Political Organization

At every stage of the electoral and governing process, wealthy Americans dominate.56 They vote at higher rates, they contribute more frequently and in greater amounts to campaigns, they volunteer more often on political campaigns, and they are more likely to contact a representative about an issue.57 In

55. The legal reforms we suggest are targeted to generate organizing among people in specific income classes but not targeted to generate political organizing among people who hold specific political views. As a result, it is possible that our reforms would facilitate organizing by those who hold reactionary views as well as those who hold progressive ones. Of course, it will remain critical to combat discriminatory and exclusionary political developments through other means.

addition, wealthy individuals are, and have always been, far more likely to serve as elected and appointed leaders than are working-class and poor Americans.\(^58\)

The story of how economic elites, as individuals, dominate campaign spending, lobbying, and elected office is likely familiar to most readers. Less well known is the relationship between inequality and political organization. Here, too, the picture is one of domination by the wealthy. Those in the top income quintile, for example, are far more active in organized political groups.\(^59\) They can more easily bear the economic costs of organization, and they are more likely to possess the skills, information, resources, and media savvy essential to the successful functioning of such groups.\(^60\) Similarly, business organizations are dominant in both federal- and state-level politics. Indeed, the majority of organized, national political groups focus on economic issues, and of these, more than three-quarters represent business interests.\(^61\) Over three-fourths of lobbying expenditures are made on behalf of corporate America.\(^62\) Political participation by business and the wealthy, moreover, vastly outpaces participation by organizations of the nonwealthy: business groups outnumber and far outspend organizations of working-class and poor Americans.\(^63\)

This inequality in political organization has not always been so severe. In the years after the Civil War until the mid-twentieth century, American civil society was made up of numerous federated organizations with membership from the working class. In the early twentieth century, labor organizations like the Knights of Labor, the American Federation of Labor, and the early industrial unions, along with civic organizations like the National Consumers League and National Urban League, engaged millions of low- and middle-income Americans and immigrants in grassroots political activity. Members participated in organizational meetings, decisionmaking, and leadership, as well as in political action at the local, state, and federal levels. Notably, these organizations were primarily member-funded. They were by no means perfect—some were exclusionary or segregated on the basis of race or gender—but they engaged Americans in democratic, political activity at all levels.

Progressive era intellectuals, writing against the background of a political economy with significant parallels to today’s, understood that working people’s organizations could redistribute power over political decisionmaking and thereby could ensure a more egalitarian political economy. John Dewey, for example, wrote of a society of citizens whose equality was guaranteed by their participation in voluntary associations with real power in the governance process.
Public opinion and the ballot, he argued, were insufficient tools to achieve change. For the public to solve its problems, organizations of citizens, and organizations of working-class Americans in particular, “needed concrete ways to exercise power over the range of economic and political decision making.”68

Following the Great Depression and the resulting protest movements among the unemployed and industrial workers, the New Deal fostered a rapid growth in the organization of the working class.69 In 1935, Congress enacted the National Labor Relations Act (NLRA), which guaranteed workers the right to organize and bargain collectively with their employers.70 In 1935, John Lewis of the United Mineworkers and Sidney Hillman of the Amalgamated Textile Workers Union formed the new Committee for Industrial Organization (CIO), with the goal of organizing all workers, immigrant and native-born, male and female.71 The CIO’s success was remarkable. In the year following the United Auto Workers strike at General Motors in Michigan, nearly five million workers took part in industrial action, and almost three million joined a union.72 Over the next decade, unions continued to grow, with some becoming a vehicle for the empowerment of Black Americans as well as a force for rising living standards, workplace democracy, and political change.73

The 1950s and 60s saw the rise of several new transformative social movements among low- and middle-income Americans.74 In particular, the Civil Rights movement organized Black Americans and their allies, engaging them in a political struggle against racial injustice, including its economic dimensions.75

The National Welfare Rights Organization and numerous related community-based groups organized welfare recipients and the poor more generally.76 Union organization among service workers and public-sector workers expanded during this period as well.77

By the 1970s, however, membership organizations began to decline in prominence.78 Theda Skocpol estimates that membership in the federated mass-membership organizations built in the Progressive and New Deal eras dropped by sixty percent between 1974 and 1994.79 Today, less than a third of the organizational advocates operating in Washington are membership associations of any kind, and only about an eighth are membership associations of individuals.80 Although groups associated with the 1960s social movements have survived, they are no longer democratically governed mass-membership organizations. Most are now professionally managed advocacy groups, organized as charitable nonprofits funded mainly by wealthy donors.81

Labor unions stand as an exception to this dominant model. Their membership and funding are still drawn from working Americans, and unions are still federated, national organizations whose members have governance rights and the organizational capacity to exercise power in the political economy.82 Unions provide voice for millions of Americans, enabling workers to improve collectively

their wages, benefits, and working conditions. They also have significant political and civic impact by educating workers about political issues, mobilizing them to support political candidates, contributing financially to political campaigns, and successfully advocating for policy changes at the local, state, and federal levels. Researchers have found that unions are remarkably effective at boosting voter turnout, particularly among the least educated and least well-represented in the electorate. States with higher union density tend to have higher turnout rates among the working class. And union members, as a result of their experience with politically impactful and democratic organizations, tend to join more civic associations. In short, unions enable workers to participate

collectively at every level of politics and government, equalizing power in the political economy and providing a countervailing voice to organized business groups.88

At their high point in the 1950s, unions represented about a third of workers.89 Since the 1970s, however, the labor movement’s size and power have declined considerably. This is partly a result of weaknesses in the original NLRA, antiunion reforms in the 1947 Taft-Hartley Act, and a host of Supreme Court decisions that privilege employers’ managerial and property rights over workers’ right to organize. After decades of capital flight, the fissuring of the employment relationship, and intense managerial resistance, unions now represent only about six percent of employees in the private sector and ten percent of the labor force overall.90 Recently enacted antiunion laws in previously union-dense states, along with the Supreme Court’s decision in Janus v. American Federation of State, County & Municipal Employees, further threaten unions’ ability to exercise effective political voice.91 In short, unions remain politically active and continue to provide substantial resources to proworker candidates, but because

B. Political Inequality in a Democratic Republic

The impact of these developments on the health of American democracy is stark. Political scientists including Larry Bartels, Martin Gilens, and Benjamin Page are finding that government policymaking is responsive to the views of poor- and middle-income Americans only in settings where the balance of interest-group power aligns with the preferences of these income groups.93 This finding confirms the critical role played by political organization, but it also confirms that in contemporary America—where the wealthy dominate political organization—government is by and large unresponsive to the views of the vast majority of citizens.94

By examining two thousand public-opinion surveys conducted between 1981 and 2002, and federal policy adoption during that same period, Gilens estimated the extent to which different income groups influence policy outcomes.95 His findings are unambiguous: with a single exception, “when preferences between the well-off and the poor diverge, government policy bears absolutely no

94. As with all empirical findings, there is debate about the extent to which Gilens’s and Page’s findings hold up. See Dylan Matthews, Remember that Study Saying America Is an Oligarchy? 3 Rebuttais Say It’s Wrong., Vox (May 9, 2016, 8:00 AM EDT), https://www.vox.com/2016/5/9/11502464/gilens-page-oligarchy-study (summarizing the critiques). relationship to the degree of support or opposition among the poor.”96 Moreover, even when the poor and middle class agree with each other and disagree with the wealthy, it is still the views of the wealthy that predominate. Hence, “for Americans below the top of the income distribution, any association between preferences and policy outcomes is likely to reflect the extent to which their preferences coincide with those of the affluent.”97 The rare exception occurs when organized political-group power is aligned with the preferences of the poor and middle class.98

The Gilens findings, moreover, hardly stand alone. Other recent work reveals that “the views of constituents in the bottom third of the income distribution receive[ ] no weight at all in the voting decisions of their [S]enators.”99 Likewise, Presidents often respond to the “narrow political and economic interests” of the wealthy.100 And, at the state level, “the poor have next to no influence over . . . policy.”101 Summarizing these findings, Gilens and Page conclude bluntly that in twenty-first-century America, “the majority does not rule—at least not in the causal sense of actually determining policy outcomes.”102

A political system in which government policy is responsive to the preferences of the wealthy few rather than to the majority of citizens may be more accurately categorized as an oligarchy than as a democracy or a republic.103

103. Like the political-science literature on which we rely, we use the term “preferences.” However, we are not of the view that preferences are in any sense static or that the relationship between preferences and policymaking is unidirectional. Indeed, our analysis proceeds on the assumption that preferences are dynamic and subject to change through processes that include organizing. Put differently, the idea that government should respond to the preferences, priorities, and concerns of constituents is consistent with the idea that those preferences change over time through deliberation, contestation, and collective debate. Cf. Lisa Disch, Democratic Representation and the Constituency Paradox, 10 PERSP. ON POL. 599, 610 (2012) (challenging the focus on responsiveness to preferences and concluding that “[t]he fundamental
Indeed, in an influential recent book, political-science professor Jeffrey Winters defends the claim that the United States is now functioning as an oligarchy. As he describes the current political reality, “regardless of the other ways in which political power might be equal – such as one-person-one-vote or an equal right to speak or participate – yawning differences in material power create enormous inequalities in political influence and account for key political outcomes won by oligarchs.”

But, whether best described as an oligarchy or not, the lack of government responsiveness to the views and desires of the vast majority of citizens is a serious problem for a democratic republic.

Indeed, nearly all democratic theorists consider responsiveness to constituents as an important feature of a functioning democracy. As Robert Dahl put it, “[A] key characteristic of a democracy is the continuing responsiveness of the government to the preferences of its citizens, considered as political equals.” Hannah Pitkin, explicating the complicated nature of representation, concluded that, at the very least, representatives “must not be found persistently at odds with the wishes of the represented.” So, too, the Supreme Court, even as it has struck down campaign-finance regulations, has reiterated that “responsiveness is key to the very concept of self-governance through elected officials.” Nicholas Stephanopoulos puts this widely accepted point in terms of political “alignment,” arguing that alignment occurs when “the preferences of voters are congruent with the preferences of their elected representatives,” with respect to partisan affiliation, public-policy views, and public-policy outcomes. He argues that Madisonian, minimalist, pluralist, participatory, and deliberative democrats all put some version of alignment between voter preferences and representative behavior as an important component of their views of what comprises “democracy.”

Although the relationship between preferences and policymakers in a democracy is neither simple nor unidirectional,111 the current U.S. government described by Bartels, Gilens, Page, and others is one defined, quite simply, by misalignment and unresponsiveness: the concerns of the majority are rarely reflected in government policy unless by coincidence, and instead that policy aligns with the preferences and priorities of a small, wealthy minority. This mismatch is a problem, moreover, not just from the perspective of democratic government, but from the perspective of republican government as well.112

The Constitution, of course, requires that the “United States . . . guarantee to every state in this Union a Republican Form of Government,”113 a guarantee taken to extend to the structure of the federal government as well.114 As with democracy, there is robust debate about the particular characteristics of a “republican form of government,” but widespread agreement exists about its core

112. The reforms we urge also serve other important democratic goals, including that of increasing and equalizing participation. As democracy-law scholars have argued, participation enhances the legitimacy of electoral outcomes, exposes government officials to more of the public’s views, and connects voters more closely to their representatives. See, e.g., Christopher S. Elmendorf, Undue Burdens on Voter Participation: New Pressures for a Structural Theory of the Right to Vote?, 35 HASTINGS CONST. L.Q. 643, 677 (2008); Pamela S. As such, the reforms urged in this paper should appeal even to those scholars who argue that because public opinion is “a continuous process” that is “never definitively represented,” “[t]here is thus no ‘baseline’ from which ‘distortion’ can be assessed.” ROBERT C. POST, CITIZENS DIVIDED: CAMPAIGN FINANCE REFORM AND THE CONSTITUTION 53 (2014). Moreover, though adequate discussion is beyond the scope of this Article, normative theories of nondomination, self-determination, and agonism also lend support to the kinds of organizational reforms this Article advocates. features. Akhil Amar, for example, concludes that “majority rule popular sovereignty” is a “central pillar” and the “central meaning” of Republican government.\(^{115}\) Quoting from Federalist No. 39, Amar concludes, “Republicanism must be defined as against aristocracy and monarchy—as ’a government which derives all its powers . . . from the great body of the people.’”\(^{116}\)

Like Amar, both Jack Balkin and William Forbath define republican government by way of contrast to aristocracy and, of particular relevance here, to oligarchy. Balkin explains, “[T]he Founders opposed republicanism . . . to monarchy, aristocracy, and oligarchy. A republic is therefore an antimonarchical, antiaristocratic, and anti-oligarchical form of government.”\(^{117}\) And Forbath warns, “You cannot have a constitutional republic, or what the Framers called a ‘republican form of government’ . . . in the context of gross material inequality among citizens [because] gross economic inequality produces an oligarchy in which the wealthy rule.”\(^{118}\)

C. Extant Approaches to Using Law to Combat Political Inequality

In light of the problems for democratic and republican government posed by the current unresponsiveness of American government, legal interventions designed to rebalance political power as between the wealthy and the nonwealthy are essential.\(^{119}\) The public-law literature has identified ways in which extant law
works to redistribute political power. In his *Harvard Law Review* Foreword, Daryl Levinson lays out four areas of public law that are concerned with “distributing power among political interests”: election law, judicial intervention on behalf of groups lacking political power, campaign-finance law, and anticapture judicial review (along with institutional design) in administrative and constitutional law.  

Although these areas are not designed to facilitate organizing among working-class voters, they all share an ambition of equalizing political power so as to correct for imbalances that would otherwise plague democratic participation.  

For example, Levinson shows how parts of election law—or, the law of democracy—advance this goal. He explains that “the ideal of equalizing political power continues to serve as a normative touchstone in debates about how electoral rules and institutional structures should be designed” and that “in at least one area of election law the goal of redistributing political power has always been front and center: the enfranchisement and political empowerment of previously excluded black voters.” To ensure that Black voters not only have the formal right to vote but are also “effectively represent[ed],” the federal government banned at-large election systems that diluted the power of Black minorities and also required the construction of majority-minority districts to empower these minorities actually to elect their desired representatives. Levinson also shows how judicial enforcement of constitutional rights to protect “politically powerless” groups, à la *Carolene Products* and political-process theory, is a second

area where law redistributes political power. Indeed, the essence of the *Carolene Products* footnote—and of political-process theory—is that certain groups lack an appropriate level of political power and that the law ought to step in to compensate for that absence. Thus, the Supreme Court has long held that a group’s political powerlessness is a relevant factor in determining whether that group qualifies as a suspect class and is therefore entitled to heightened judicial protection. As Levinson writes,

In the first instance, the *Carolene Products* approach calls for courts to rearrange the democratic process in order to fully empower disenfranchised groups. Failing that, however, courts are then charged with replicating the policy outcomes that would have resulted from an idealized process in which all groups exercised their fair share of power.

What we propose are legal interventions of a different sort but with the related goal of rebalancing political power in the direction of political equality. In essence, we suggest multiple ways that the law might enable low-and middle-income people to build organizations with political power—organizations aiming to increase the responsiveness of government to the policy preferences of low- and middle-income Americans, while at the same time shifting power relations between powerless individuals and powerful economic actors like employers, landlords, welfare agencies, and banks. These organizations would aggregate the political voice and resources—financial and human—of their members.

It is through such aggregation that these organizations would amass political power and could thereby serve as a counterweight to the political influence that flows from wealth. As Joshua Cohen and Joel Rogers have explained,

127 Cohen & Rogers, supra note 20, at 424.

[I]nequalities in material advantage ... translate directly to inequalities in political power. Groups can help remedy these inequalities by permitting individuals with low per capita resources to pool those resources through organization. In making the benefits of organization available to those whose influence on policy is negligible without it, groups help to satisfy the norm of political equality.127

The closest extant analogue to what we propose in this Article is federal labor law. As we have explained previously, “In the United States, the legal regime that has most successfully facilitated lower- and middle-class political organizing has been labor law.”128 Despite its many flaws, which we explore below, labor law has helped workers build powerful political organizations (i.e., labor unions) through several basic mechanisms. First, labor law explicitly grants workers the right to organize and strike, creating a “frame” for collective action. Second, labor law has historically provided workers with a viable and sustainable organizational funding mechanism by requiring employers to bargain over payroll-deduction systems, and it has provided workers access to some of the information necessary for organizing. Third, the law provides workers the right to use the workplace as a geographical site for organizing by, for example, granting employees the right to discuss unionization on company property and, in limited contexts, allowing nonemployee union organizers to do the same. Fourth, the law plays a critical role in facilitating organizing by promising to insulate workers from employer retaliation.129 Fifth, the law grants workers the collective right to bargain with employers over terms of employment, including their wages, hours and working conditions. Finally, once organized into unions, low- and middle-income workers are positioned to exercise collective political power through electoral and administrative channels—and also through collective direct action and protest when those traditional channels fail.130

129. See Sachs, supra note 18, at 172-75. Of course, the statutory labor-law regime only needs to grant these rights because common law first grants employers near authoritarian control over workers while on employer property. The prior distribution of power is neither natural nor neutral. See infra notes 147-150.

130. See supra notes 82-88; see also Alison D. Morantz, What Unions Do for Regulation, 13 ANN. REV. L. & SOC. SCI. 515, 520 (2017) (discussing how “[u]nion involvement has helped secure the
To be sure, labor law has significant limitations, many of which we have highlighted in our own previous work: labor law excludes large numbers of workers, many of whom are women and people of color; it is characterized by weak enforcement mechanisms, leaving workers effectively unprotected from retaliation when they organize or engage in protests, strikes, or other collective activity; the law places multiple limitations on the form and content of the right to strike; and, although the law provides a right to bargain, it mandates that such bargaining occur only at the worksite level (as opposed to the sectoral or industry level, where power over working conditions is frequently exercised).131

Despite these very real shortcomings, however, labor law has served as a critical legal mechanism for facilitating the growth of powerful, collective political organizations of working people. In this way, it has been an important tool for rebalancing political power between wealthy and nonwealthy citizens. The ambition of this Article is to suggest how law might do this for low- and middle-income people more broadly and even more effectively.

II. URGENCY AND PROMISE OF A LAW OF ORGANIZING

Such a project is necessary because the democracy-reform proposals that have captured scholarly or political attention to date would do little to build countervailing social-movement organization among working-class and poor Americans. Instead, most scholars and advocates propose reforms to campaign-finance and lobbying law, increasing the voting rights of individual citizens, and improving transparency in politics and government.132 While important, such proposals have limited capacity to create a more equal political economy. Limitations on the ability of the wealthy to fund campaigns or lobbying, in particular, would require the Supreme Court’s First Amendment doctrine to be overruled by a new alignment on the Court or by constitutional amendment.133 Moreover, such reform faces significant practical hurdles. Money finds new channels when campaign-finance and lobbying regulators shut down one avenue; therefore, capping contributions or even expenditures is unlikely to have much effect.134

So, too, efforts to protect the right to vote at the individual level are essential. But participation through voting is only one small way in which citizens participate in politics and governance. Likewise, making it easier for a diverse range of participants to lobby,¹³⁶ or to engage in the regulatory process more broadly,¹³⁷ are worthy goals. But without greater organization, poor and working-class Americans are unlikely to engage their legislators or the administrative state effectively.

Legal interventions designed to facilitate and increase the power of countervailing mass-membership organizations are a necessary complement to...
proposals that have thus far dominated reform debates. Organizations permit low- and middle-income individuals to pool resources and speak with a stronger voice.\textsuperscript{138} Organizations can turn out voters, involve citizens in lobbying, and influence public debate.\textsuperscript{139} They can also help shape regulatory agendas, comment on proposed rules, press for agency-enforcement activity, and navigate the complicated and fragmented processes of government. When political organizations are membership groups, rather than professionally managed “check-book” organizations, their participation helps facilitate more equal political involvement, while giving Americans a chance to practice democracy on a more regular basis.\textsuperscript{140}

Historians have illuminated the instrumental role mass-membership organizations played in the passage of a host of legislation—including labor legislation, the GI bill, and civil-rights legislation—even in the face of staunch opposition from elites.\textsuperscript{141} Social-movement theorists and legal scholars of movements have likewise demonstrated the critical role that movement organizations played in winning changes in law and policy.\textsuperscript{142} Recent quantitative empirical work supports the conclusion that organization is essential to achieving a more equitable democracy. As we have noted, Gilens finds an exception to the general rule that policymakers are far more responsive to the preferences of the wealthy: where countervailing interest-group power is exerted, government policy no longer simply tracks the preferences of the wealthy.\textsuperscript{143} Rather, on issues where

organized groups advance the preferences of low- and middle-income Americans, government outcomes more often correspond to the preferences of low- and middle-income Americans. Consistent with these findings, the state and local governments that have been most active in attempting to redress wealth inequality of late are those operating in regions with higher levels of organization among working people.

The legal literature frequently treats the paucity of collective organization among nonelites as an inevitable collective-action problem, a natural occurrence. In reality, however, the lack of organization among low- and middle-income Americans—along with the strength of organization among elites—is, in part, a product of law. As Lauren Edelman and Mark Suchman have written, “[O]rganizations are not ‘real’ primordial creatures, but are social constructions, defined and given meaning in large part by legal institutions.” Legal forms sometimes directly influence organizational behavior and performance. On other occasions, law shapes organizational practices less directly, by contributing to an underlying cultural logic of “legal-rationality.” As legal realists, critical legal scholars, and, more recently, the burgeoning Law and Political Economy movement, have pointed out, law constructs economic and political power.

For example, Martin Gilens found that unions are among the most important forces moving policy in a direction desired by the less well-off. See supra notes 85-87 (collecting political-science research on unions and governmental responsiveness).

So, too, the landscape of organizational life—and the rights and power wielded by different organizations—are neither natural nor neutral.

Thus, law has played a critical role in constructing the modern corporation;\(^{151}\) in shaping the boundaries between private firms, public agencies, collective enterprises, and nonprofit organizations;\(^{152}\) in empowering and constraining the modern trade union;\(^{153}\) and in enabling some forms of economic coordination, while disabling others under antitrust law.\(^{154}\) Ultimately, it is a background economic and social conditions, formal freedom of contract did not reflect a truly free choice. matter of political choice which organizations deserve status, protection, and rights under law.\textsuperscript{155}

In circumstances when the political choice has been to facilitate poor and working people’s organizations, that choice has had effect. Indeed, recent empirical work on constitutions suggests that protecting organizational rights, including the right to form labor unions and political parties, has greater effect than granting individual rights because such organizations have both incentives and means to protect substantive rights.\textsuperscript{156} The labor context in particular provides numerous examples of how law can further organization building. For example, in the five months following congressional recognition of the right to organize in the 1933 National Industrial Recovery Act, 1.5 million workers joined unions, an increase described by one scholar of the period as “dramatic.”\textsuperscript{157} In just six years following the enactment of the NLRA in 1935, more than six million workers organized,\textsuperscript{158} a massive increase from the earlier period in which law punished collective action among workers rather than facilitating it.\textsuperscript{159} The subsequent passage of the Fair Labor Standards Act (FLSA) — which in its initial form gave unions a privileged position in negotiating wage minimums on an industry-by-industry basis and empowered them to bring collective actions against wage violations — further buoyed organizing among workers.\textsuperscript{160} And during World War II, the tripartite War Labor Board, which afforded labor a relatively unprecedented role in setting national labor and employment policy, along with pro-union decisions from the National Labor Relations Board (NLRB), helped

To be clear, our claim is not that law was the only, or even the primary, factor driving the rise and fall of unionization over the course of the twentieth century. As one of us has detailed in prior work, and as numerous scholars have documented, the legal regime was but one of multiple factors playing a role in the rise and fall of unions. produce an explosion in union density, with the number of workers in unions growing from nine to fifteen million over the course of World War II. 161

Conversely, the passage of the Taft-Hartley Act, which significantly constrained union rights, the repeal of the FLSA industry committees, and numerous subsequent doctrinal developments narrowing labor rights, correlate with a decline in union organization. 162 In particular, the Taft-Hartley Act altered federal policy so that it no longer expressly favored workers’ collective rights, instead balancing those rights with employees’ “full freedom to refrain from engaging in union activity.” 163 Moreover, the Act codified employers’ right to campaign against unionization, permitted individual states to pass “right to work” laws banning union-security agreements, and limited workers’ ability to exercise power over the economy by forbidding unions from engaging in secondary boycotts. 164 Though scholars disagree on the extent to which Taft-Hartley was a turning point or a codification of preexisting court precedent, little disagreement exists that the statutory amendments weakened labor unions, the social-movement organizations that prior law had previously helped facilitate. 165

Law thus matters to the possibility of organizing for countervailing power. But the question remains, what would a legal regime explicitly designed to facilitate organizing by the poor and working class in contexts beyond labor look like? We offer ways to approach that question in the next Part, and to animate the analysis to come, we conclude this Part with a thought experiment—by imagining what a law designed to facilitate organizing would look like in a real-world context. For these purposes, consider housing. Today, when local zoning commissions, city councils, state legislatures, state and federal agencies, and Congress discuss housing policy, real-estate developers and landlords spend millions on lobbying.\textsuperscript{166} Affluent, single-family home owners turn out in force.\textsuperscript{167} The mortgage and construction industries are typically active as well.\textsuperscript{168} But Section 8 recipients, poor renters, and the homeless—a group that is growing again after a decade of decline\textsuperscript{169}—rarely participate equally in the discussion, let alone exercise significant influence over decisionmaking.\textsuperscript{170} Meanwhile, rents and home purchase prices are rising much faster than income, with the median home

price in some 200 cities approaching $1 million and “almost half of all renters pay[ying] more than 30 percent of their income in rent.”171

In numerous cities and states, faced with unaffordable rents and substandard housing, tenants are organizing.172 Indeed, in response to mass unemployment and economic distress resulting from the COVID-19 pandemic, tenant groups have organized numerous protests and rent strikes, while also pushing for new laws that commit funds to housing construction and restrict the unfettered ability of landlords to raise rents.173 But the groups are typically local, they struggle for funding, and they are most active in a few urban centers like Los Angeles, San Francisco, and New York.174 In many areas of the country, particularly in suburbs and rural communities, there is little organization among tenants or the homeless, and there is no legal infrastructure for their mobilization and political success.

Imagine, then, a new law of tenants’ unions that would foster incipient organizing. What should such a law look like? The discussion below suggests that the law should explicitly convey that substandard and unaffordable housing is an injustice and that tenants have a collective right to organize to achieve fair housing for all. The legal regime should guarantee safe spaces in which tenants and organizers could meet and discuss concerns about their housing conditions; give organizers the right to access properties to engage tenants in organizing; and

provide organizers with information, such as tenants’ names and contact information, as well as information about the housing market. As important, the law should create new mechanisms to fund tenant organizations, supplementing charitable donations with a dues system paid through rent check-off and subsidies from the government and landlords themselves. It should provide resources to train tenant leaders and allow them leave from their jobs so they could engage in housing organizing and policy work. It should allow tenants to bargain collectively with their landlords about problems in their buildings, while also giving tenant organizations a seat at the table during administrative processes regarding housing policy. By creating federated organizations, the tenant organizations could develop sufficient power to challenge local, national, and multinational corporate entities that influence housing policy.

Such organizations could also deploy their newly developed political power in ways that go beyond the particular issues around which they formed: just as labor unions speak across a range of policy questions broader than “labor” issues, tenants’ unions could as well, using their resources to further broader-based political organizing. The law should protect such “bargaining for the common good.” It also should guarantee the right to protest and to strike, free from retaliation by the government or the private landlord.

To be sure, this legal regime would not spontaneously or inevitably create robust social-movement organizations with political power at the local, state, and federal level. Many factors beyond the reach of law influence the ability of social-movement organizations to form and to thrive, including political opportunities, underlying economic trends, leadership capacity, and the commitment and energy of individual organizers. But law matters, and in the next Part we suggest a host of ways in which law can be structured to facilitate organizing for countervailing power.

III. FACTORS AND FACILITATORS

Having illustrated in the last Part the importance of stronger countervailing social-movement organizations and the plausibility of legal intervention to encourage their growth, in this Part, we show how law can facilitate organization

176. In turn, the law might require the organizations to commit to independence, to democratic governance, to financial disclosure, and to nondiscrimination, inclusion, and a duty of fair representation. For a brief discussion of duties, see infra note 384.

in contexts that are populated by low- and middle-income Americans and rife with exploitation and power imbalances. To do so, we draw from the social-science literature, as well as from the experiences of labor law, to offer a more nuanced and theoretically grounded picture of how a different set of legal choices could help facilitate conditions critical to organizing success. We undertake this analysis with the recognition that while this literature is revealing and suggestive, it does not aspire to be firmly predictive. \(^{178}\) We begin, in other words, with the premise of Saul Alinsky’s seminal work on organizing theory: “At no time in any discussion or analysis of mass movements, tactics, or any other phase of the problem, can it be said that if this is done then that will result. The most we can hope to achieve is an understanding of the probabilities consequent to certain actions.”\(^{179}\) In this spirit, the discussion that follows aims to illuminate a series of legal interventions that would make organizing by the poor and working class more probable even if not certain.

**A. Framing**

A prominent strand in the social-movement literature stresses the importance of a symbolic or social-psychological requisite for successful collective action.\(^{180}\) Put simply, this school of thought is concerned with understanding the cognitive work that goes into translating the raw “events or occurrences” of everyday life into issues around which people organize collectively.\(^{181}\) This body of work thus examines the role played by “collective action frames,” which are “action-oriented sets of beliefs and meanings that inspire and legitimate the activities and campaigns of a social movement organization.”\(^{182}\)

Although the framing literature is now vast, the leading work in the field can be productively condensed by focusing on four core aspects—or “tasks”—of collective-action frames: diagnostic framing (which involves both problem

180. See generally Pedriana, *supra* note 40, at 1719 (analyzing the “legal framing of the women’s movement in the 1960s” to “further develop theoretical knowledge on the cultural and symbolic processes that enable, constrain, and transform social movements”).

identification and blame attribution and which is alternatively named “injustice” framing in the literature); prognostic framing (which involves developing a potential collective approach to addressing the identified problem); motivational or agency framing (through which the collective efficacy of the group to carry out the approach is implied); and identity framing (in which the collective identity of the group that will carry out the approach is developed).183 Taken as a whole, the literature suggests that successful political organizing is enabled by collective-action frames that diagnose injustices, suggest collective solutions, motivate collective responses, and generate collective identity. In this Section, we review each of these four core framing tasks and then move to discuss ways in which law might be deployed to facilitate each of them.

According to Robert Benford and David Snow, the first thing a collective-action frame must do if it is to enable collective action is help potential-movement participants diagnose some set of conditions as a problem that ought to be remedied, rather than as a set of conditions that, although undesirable, is a natural, perhaps unavoidable part of life.184 For William Gamson, such diagnostic work in the context of political action and mobilization necessarily involves diagnosing a set of conditions as an injustice.185 This is critical because injustice, unlike a mere problem, brings forth what Gamson calls “hot cognition, not merely an abstract intellectual judgment about what is equitable,” but “righteous anger that puts fire in the belly and iron in the soul.”186 For both sets of authors, problem identification is not enough: diagnosis must also involve blame attribution. In Benford and Snow’s words, “[s]ince social movements seek to remedy or alter some problematic situation or issue, it follows that directed action is contingent on identification of the source(s) of causality, blame, and/or culpable agents.”187 For Gamson, “[a]n injustice frame requires a consciousness of motivated human actors who carry some of the onus for bringing about harm and suffering.”188

Gamson, moreover, usefully distinguishes between different types of agents that might be blamed for the injustice diagnosed in a collective-action frame. At one end of the spectrum lie abstract, structural forces like the economic system, the political order, and the government. At the other end of the spectrum are individual human actors like a particular manager or landlord. Blaming an abstraction like the market or the political system risks diffusing the “indignation”

that Gamson finds essential to successful diagnostic framing. On the other hand, blaming particular agents risks shifting attention from structural forces that are legitimately responsible for people’s suffering. Thus, Gamson concludes that frames, to facilitate collective action, must work to attribute blame somewhere between broad, abstract structural forces and discrete human actors. As he writes:

To sustain collective action, the targets identified by the frame must successfully bridge abstract and concrete. By connecting broader sociocultural forces with human agents who are appropriate targets of collective action, one can get the heat into the cognition. By making sure that the concrete targets are linked to and can affect the broader forces, one can make sure that the heat isn’t misdirected in ways that will leave the underlying source of injustice untouched.¹⁸⁹

So, perhaps, the injustice of low wages is laid at the feet of neither capitalism nor the factory superintendent, but the corporation that controls the employment relationship or even the corporations that make up the relevant economic sector. And the injustice of high rent and poor living conditions is laid at the feet of neither the market nor a particular building owner, but the landlords who have undue influence at the city council and state legislature.

Once an injustice is identified, and blame properly attributed, a successful collective-action frame then must identify and communicate an approach toremedying the injustice: it must, according to Benford and Snow, “articulate[e] ... a proposed solution to the problem, or at least a plan of attack, and the strategies for carrying out the plan.”¹⁹⁰ Importantly, although there must be a connection between prognosis and diagnosis — how to address a problem depends on the nature of the problem to be addressed — the articulation of injustice and attribution of blame narrows but does not determine how to address the injustice.¹⁹¹ This point may be obvious, but it is worth noting. Take the injustice of low wages in the fast-food industry as attributed to the five largest corporations controlling that industry. A range of approaches to remedying the injustice are plausible. Workers might, for example, sue the corporations under wage-and-hour laws, picket their restaurants as a means of pressuring the corporations, or organize into unions and attempt to bargain collectively wage increases. Any of these approaches would constitute a plausible approach to the injustice. The prognostic work of a collective-action frame involves articulating one or

¹⁸⁹. Id. at 33.
¹⁹⁰. Benford & Snow, supra note 182, at 616.
more of these approaches: this allows participants to formulate a viable plan of attack.

The first two framing tasks—diagnostic and prognostic—involve cognitive work about dynamics external to the mobilizing group: what is the injustice and who is causing it. The second two tasks—motivational and identity—involve cognitive work internal to the mobilizing group. This is work focused on bringing participants into motion and struggle, in an effort to build a collective identity. For Benford and Snow, motivational framing involves a call to action, the “construction of appropriate vocabularies of motive” that provide prods to action by, among other things, overcoming both the fear of the risks often associated with collective action and Olson’s vaunted free-rider problem.\(^{192}\) Gamson, who names this framing task “agency,” describes its function in terms of efficacy. Thus, to fulfill the agency task, a collective-action frame must give participants a sense both that they are capable of redressing the injustice in question and that their opposition is vulnerable to challenge. The frame must imply that “it is possible to alter conditions or policies through collective action” and must “deny the immutability of some undesirable situation.”\(^{193}\) In even simpler terms, the motivational task involves a communication to potential participants that “we can do this.”

As the above suggests, however, there remains a final task for the frame: defining, or creating, the “we” that can successfully act collectively against the articulated injustice. Gamson names this framing task “identity”: the process by which a collective identity among movement participants is constructed.\(^{194}\) Indeed, in stressing the importance of this kind of collective identity, this aspect of framing theory is resonant with other strands of social-movement theory which are centered around the observation that successful movement building and mobilization are enabled by the existence of a collective identity among movement participants. For example, Bert Klandermans, a leading scholar of identity and movement participation, writes that “[t]he basic hypothesis regarding collective identity and movement participation is fairly straightforward: a strong identification with a group makes participation in collective political action on behalf of that group more likely.”\(^{195}\)

Here, the identity-construction task of a collective-action frame is connected closely to the blame-attribution task. As Gamson explains, in the political

context, collective identities are often oppositional: the “we” exists in opposition to a “they,” where “they” are the agents responsible for the injustice. Thus, if the injustice of low wages paid to fast-food workers is attributed to a particular manager, the “we” who can fight that injustice will be a narrow group, probably just those impacted by this particular manager’s actions. On the other hand, if low wages are attributed to the five largest corporations in the fast-food industry, the “we” can be all fast-food workers.

This is not to imply that collective identity flows ineluctably from successful blame attribution. However, collective-action frames can contribute to collective-identity construction, not only by identifying an oppositional “they,” but also by increasing the salience of certain aspects of potential participants’ identities. Because identities “exist in a hierarchy of salience,” the more salient an aspect of identity is, the more likely it is that the individual will act in accordance with that identity. For example, all individuals who live in a certain neighborhood will share a collective identity of neighborhood resident. This identity may remain largely irrelevant for much of an individual’s life and never form the basis for action of any kind. But, as Klandermans teaches, if the government constructs a waste-disposal plant in the neighborhood, “[c]hances are that within a very short time the collective identity of the people living in that neighborhood becomes salient.” Finally, we know from Bernd Simon’s work that a shared sense of unjust treatment can increase the salience of a collective identity that is the basis of that unjust treatment. For example, racial- and religious-based discrimination has functioned throughout history to increase the salience of collective identities based around racial- and religious-group membership. Thus, by framing certain events or occurrences as injustices, a frame can increase the salience of a collective identity built around the shared experience of that injustice. Framing low wages in the fast-food industry as an injustice suffered by all fast-food workers can contribute to the activation of a collective identity among fast-food workers. Framing high rents as an injustice suffered by tenants in a city can activate a collective identity of city tenants.

196. GAMSON, supra note 185, at 7-8.

In sum, then, theorists posit that successful collective action can be enabled by collective-action frames that accomplish four interrelated tasks: they diagnose an injustice and attribute blame for it; they elaborate a means of remedying the injustice; they motivate participants to fight for that remedy; and they help activate the identity of the collective who will do the fighting. As some social-movement theorists recognize, moreover, law has the capacity to serve as a powerful collective-action frame. Indeed, civil-rights law is often identified in the social-movement literature as a “master frame”—a frame that “resonate[s] deeply across social movements and protest cycles.”

In the workplace context, legal scholar Jennifer Gordon describes the powerful way that rights have served as a collective-action frame:

The idea that employers were supposed to be acting differently—that in paying so little and demanding so much they were ignoring a set of established norms, codified as rights—suggested a less individualized, more systemic explanation of the problems immigrant[] workers faced in trying to earn enough money to support themselves and their families. . . . If the problem was systemic, immigrant[] workers would need to respond in kind.

And workplace statutes can also fulfill the diagnostic and prognostic work of collective-action framing.

But how might we tailor legal interventions in a manner designed to enable laws to serve as collective-action frames more generally? We think the ideal way to do so is as follows: couple statutory provisions of substantive standards with the right to organize collectively to enforce those standards and to achieve greater substantive protections in the future. For purposes of this discussion, imagine a statute that affirmed a right to adequate and sustainable housing, granted tenants the right to just-cause eviction, and also granted tenants a right to organize unions. The organizing right would include, among other things, the right of organizers to access tenant contact information; the right of organizers to come onto building property to speak to tenants and a free building space for the tenants’ union to meet; a robust antiretaliation guarantee; an obligation for the

See Alexander, supra note 44, at 248 (showing how housing movements are constructing “the human right to housing in American law by establishing through private and local laws a right to remain, a right to adequate and sustainable shelter, a right to housing in a location that preserves cultural heritage, a right to a self-determined community, and a right to equal housing opportunities for nonproperty owners”).
building owner (or other relevant economic actor, such as real-estate investment trusts) to bargain with a union once it was formed; and the right of the union to a seat at the table in administrative processes regarding housing policy. Such a statute has the potential to fulfill all four framing tasks.

With respect to diagnosis, the statute would clearly identify an injustice and attribute blame: by banning evictions without cause, the law identifies such evictions as unjust; by making building owners liable for damages, the law attributes blame to the owners. Thus, the provision of right and remedy might in themselves accomplish the diagnostic-framing task. But the law could go much further in the direction of diagnostic framing. For example, in the legislative findings or statement of purpose, the law could explicitly identify evictions without cause as an injustice by detailing the harms such evictions cause to families. The law might also name evictions without cause as one example of a broader injustice, namely the power of landlords unchecked by the collective strength of tenants. In either case, the findings and purposes can list the unjust benefits that building owners extract from without-cause evictions and can directly name owners as the source of the problem. They could go on to detail other deleterious consequences that flow from unchecked landlord discretion.

Crucially, given its status as a powerful source of social and political legitimacy, the law can offer convincing diagnoses. As a complement to diagnoses made by tenant organizers themselves, a statutory pronouncement that evictions without cause are illegal and that building owners are legally liable for violating this norm provides an additional source of diagnosis, and one that many tenants would likely credit. These suggestions, moreover, are not at all unprecedented. For example, when Congress enacted the Wagner Act in 1935, it identified an injustice and attributed blame explicitly in the statute. Thus, 29 U.S.C. § 151 states that “[t]he denial by some employers of the right of employees to organize and the refusal by some employers to accept the procedure of collective bargaining” had the effect of, inter alia, “depressing wage rates and the purchasing power of wage earners.”

With respect to prognosis, the statutory grant of organizing rights would articulate for potential participants a viable plan of attack. Here, again, the grant of rights itself might be sufficient. A law that marries a substantive right with a protected right to engage in collective action communicates that organizing is a means of remedying the injustice identified in the statute. Again, too, the law might go further in the direction of accomplishing the framing task. In particular, the findings and statement of purpose could identify the legislature’s faith in

205. See generally Pedriana, supra note 40, at 1726 (explaining how legal rights have a “powerful impact on how grievances and objectives are conceived, legitimized and acted upon in the American political system”).
the power of collective action as a means of carrying out its legislative goals. In our hypothetical statute, this might include a statement that substantive standards—the right to just-cause evictions—are generally best enforced when the protected class is organized collectively. More broadly, the findings and purposes section of the law might state that organizing would balance bargaining power between landlords and tenants and thus enable tenants to accomplish important goals beyond the protection of just-cause eviction. Here, again, there is historical precedent for law fulfilling the task of prognostic framing. Having articulated injustice and attributed blame, the Wagner Act’s findings section moves on to set out a viable plan of attack for workers. Thus, § 151 states:

> It is hereby declared to be the policy of the United States to . . . encourag[e] the practice and procedure of collective bargaining and by protecting the exercise of workers of full freedom of association, self-organization, and designation of representatives of their own choosing, for the purpose of negotiating the terms and conditions of their employment or other mutual aid or protection.

Our hypothetical statute can also perform the task of motivational framing. As the above discussion reveals, the task involves a combination of “prodding” participants into action, helping them overcome fears related to participation, and convincing them of their efficacy in combating the named injustice. With respect to motivating action, our statute signifies legal legitimation of and thus legal support for the tenants’ effort to organize unions in order to better their housing conditions. Such legitimation can motivate subsequent organizing efforts. For example, labor organizers successfully used congressional protection for the right to organize as a call to action. Thus, John L. Lewis famously translated legal protection for the right to organize into a slogan that was instrumental to the massive campaign of the United Mine Workers of America to unionize the coal mines, “The President wants you to join a union.”206 Our statute also can help overcome fears of participation by offering robust antiretaliation provisions, including significant damages for violations. And the statute can contribute to the interrelated goals of demonstrating the oppositions’ vulnerability and participants’ efficacy. The existence of the statutory right coupled with meaningful remedies is a step in the direction of establishing that landlords are vulnerable to challenge. And, as discussed above, the grant of access rights to organizers strengthens this function of the law.

Finally, the hypothetical statute can contribute to the construction—or activation—of a collective identity. By making landlords legally liable for evictions

without cause, and by granting tenants organizing rights, the statute establishes a “we” and a “they.” “We” are the tenants protected by the statute; “they” are the landlords governed by it. Of course, much of the identity-activation work will occur—if it does—as a product of organizing and struggle that the statute might itself facilitate. As tenants begin to exercise the collective rights that the statute provides and engage in contestation with their landlords, it is likely that the collective identity of “tenant” will become more salient. The statute’s contribution to this work should not be underestimated.

The hypothetical tenant-organizing statute imagined here would, of course, have analogues in multiple contexts. In the labor context, it would involve granting both new substantive standards—say, a just-cause dismissal guarantee—coupled with more robust protections for organizing than exist under current law. In the debtor context, it might involve a substantive right—cancellation of student debt—combined with a new explicit right to organize a debtor’s union.

A broader observation is in order before moving on. The ability of a law like this to accomplish the four core framing tasks is enhanced by the law’s explicitness. Coupling the grant of a substantive right with explicit protection for collective action makes clear the law’s determination that participants ought to organize to fight the injustice that the law condemns. Statutory findings and statements of purpose that name injustices and identify blameworthy agents make it even more likely that the law will effectively provide a diagnostic frame. So too, explicit legislative expression of support for organizing as a means of addressing injustice will increase the effectiveness of the law as a prognostic frame.

B. Resources

While the foregoing accounts of mobilization and organization stress symbolic factors, the literature suggests that resources of various kinds are equally important. John D. McCarthy and Mayer N. Zald, for example, argue that traditionally powerless groups have capacity to sustain movement activity only if they are able to aggregate resources through social-movement organizations. 207

Resources enable movements to form and then to engage in effective political action and protest. They help movements “convert[] adherents into constituents and maintain[] constituent involvement.” Constituents, in turn, create more resources for the movement. Ultimately, resource aggregation is critical to the ability of movements to persist over time. Daniel M. Cress and David A. Snow have observed that “fluctuation in the level of discretionary resources accounts . . . for variation in the activity levels of social movements.” Sarah Soule, Doug McAdam, John McCarthy, and Yang Su have found that resources matter more for movement formation and collective protest than numerous other factors, including political opportunities.

Empirical work demonstrating the importance of resources cuts across populations, time periods, and geography. To take just a few examples, sociologists have demonstrated the importance of resources to organizing success among national women’s and civil-rights organizations in the mid-twentieth century in the United States; homelessness-rights organizations in cities in the late 1980s and early 1990s; environmental organizations in both the United States and Western Europe; state-level suffrage organizations in the

nineteenth century; shantytown residents in Chile during the Pinochet regime; and antiapartheid activists in South Africa. Social-movement organizers recognize that a principal antecedent task to effective collective action is resource aggregation. So do their political opponents. Consider the battle over union funding that has persisted over many decades. Though union leaders and union opponents agree on little, they share a conviction that funding is essential to the success of the labor movement and its impact on politics.

While early work treated resources as an undifferentiated category, subsequent studies offer varying taxonomies of resources, tangible and intangible, upon which movements depend. Bob Edwards and John D. McCarthy provide a fivefold typology: moral, cultural, social organization, human, and material. Michael McCann discusses “instrumental” resources, which can be manipulated or exchanged in a direct way, and “movement culture” resources, which are associational bonds that contribute to effective communication and solidarity. Cress and Snow focus on four categories: moral, material, human, and informational resources. Though the literature has not settled on a single

---

way of unpacking the category of resources, certain types of resources repeatedly emerge as essential. These include: funding, informational resources, human resources, and spaces—physical and virtual. Other intangible resources, such as credibility and legitimacy, are important as well.

Obtaining sufficient resources to sustain effective organizing and political activity is a significant challenge for social-movement organizations. As Mancur Olson warned in his classic text, when an organization primarily delivers collective goods, individuals will not, on their own, bear the costs of obtaining such goods. To some extent, this familiar account is overdrawn, as many individuals participate in social movements for ideological or moral reasons, even where rational-choice theorists would predict indifference. Nonetheless, few individuals can or will bear the full costs of sustaining social movements. The problem is particularly acute among communities with limited resources.

Classic public-choice theory has long recognized the organizational advantages of high-income, well-organized constituencies in the legislative and regulatory process, but it largely treats these advantages as a given. On this account, certain interests have an inevitable advantage over a dispersed public when it comes to resources. Law might shield against these advantages, for example through limiting campaign contributions or adjusting judicial review of administrative action, but law is not itself responsible for creating the advantages. As the following Section demonstrates, however, the resource problem faced by poor people’s movements is already fundamentally shaped by law—and can be reshaped by legal intervention.

1. Funding

a. Charitable Donations: Limits and Pitfalls

The most obvious resource needed by social-movement organizations for their operation and survival is money. Currently, the law facilitates fundraising primarily through grants of nonprofit status by state governments and tax-exempt status by the Internal Revenue Service to qualified organizations. Foundations, philanthropies, and individual donors contribute to qualified nonprofit organizations of their choice. In the process, donors reduce their own tax burden. Most rights organizations in the United States are organized under section 501(c)(3) of the tax code and receive the bulk of their funding from large donations by foundations and philanthropies.

Legal-mobilization scholars largely have viewed this external funding as indispensable to successful rights litigation and social-movement building. Early social-movement theory also emphasized the extent to which professional, philanthropically funded social-movement organizations contributed to movement building in the 1960s and 1970s.

Although the value of donations to low-resourced organizations is substantial, more recent work has demonstrated that reliance on foundation money and charitable donations also has significant drawbacks. First, the tax code puts constraints on the kinds of activities in which recipients of charitable donations can

---

237. See McCarthy & Zald, supra note 46, at 1216-17.
engage.238 Organizations respond to these constraints by dividing their political activity from their nonpolitical tax-exempt activity and by limiting their political engagement.239

Accordingly, several scholars who worry about the decline of mass-membership organizations and their engagement in politics argue that the law should be reformed to permit political activity by 501(c)(3)s or at least those nonprofits that qualify as mass-membership organizations.240 But such a proposal misses the mark. Allowing 501(c)(3)s to engage in unfettered political activity would not address the fundamental problem created by social-movement organizations’ reliance on charitable donations: when most resources flow from elite donors and foundations, those entities influence which organizations are funded, shaping the overall organizational landscape. Not surprisingly, social movements that resonate with the concerns of relatively privileged social groups predominate. Groups that focus on the mobilization of the poor receive less funding and are less numerous than groups that focus on concerns of higher-income populations.241

Second, and perhaps more troubling, when poor and working people’s organizations receive most of their funding from elite donors, the democratic character of such organizations can be undermined.242 Organizations find their

priorities shaped by elites. Ultimately, such organizations become less likely to challenge structural inequalities that put elite interests at risk.

Reliance on charitable donations also tends to shift organizational priorities and tactics. Elite donors tend to show more interest in supporting litigation and policy campaigns and show less interest in funding membership mobilization, new-member organizing, and protest or other confrontational tactics. As a result, organizations develop extensive professional fundraising mechanisms, shifting resources and time away from organizing members and engaging them in collective action.

That is not to say that charitable donations are wholly unhelpful or that elites have fully captured social-movement organizations. Rather, such donations have long provided critical funding to struggling, low-income groups. Research also suggests that donations provide donors influence rather than full control. Research does suggest, however, that sources of funding influence an organization’s capacity for effective collective action.

A potential solution would be to impose more stringent caps on charitable donations, but this would result in an overall decline in funding and in an additional investment in fundraising rather than organizing.

Edwards & McCarthy, supra note 207, at 138-40; see also Piven & Cloward, supra note 41, at 5 (arguing that professionalized social-movement organizations deradicalized the movements from which they were created and led them to adopt less confrontational and more conventional tactics in social-change campaigns); Jenkins & Eckert, supra note 242, at 819, 826-27 (showing that elite patronage professionalized the Black movement, which may have accelerated movement decay but did not transform movement goals or tactics).

247. See id. at 157, 182-83 (noting that worker-center leaders reported that “foundations have not dictated their agenda” but that they “can impact priorities”).
Finally, it is worth noting that not all tax-exempt contributions carry the same level of capture risk. Daniel Cress and David Snow have found that when low-income groups receive a significant portion of their donations from “social gospelite” organizations or related social movements (e.g., religious institutions or labor unions), the risk of elite capture is reduced. In such cases, the institutions that are providing resources are themselves membership organizations, often part of the same social movement. Thus, homeless organizations have been successful by partnering with churches, while worker centers representing poor, vulnerable workers have been successful by partnering with unions. The more resource-rich social-movement organizations have enabled organizing among their impoverished counterparts. Still, overall resources available are limited under this model.

b. Self-Funding Facilitated by Law

The previous Section shows that donations are unlikely, alone, to sustain mass-membership organizations that effectively counterbalance the power of the wealthy in our democracy. There may be good reasons to maintain the flow of donations to nonprofit organizations, but a mechanism for organizations to engage in what sociologists refer to as “indigenous” funding—that is, dues or membership-based funding—is a critical supplement.

251. Notably, in recent years, some nonprofits have begun to deemphasize their reliance on tax-exempt charitable donations. See Pozen, supra note 81. One reason is that, under the recent overhaul of the tax code, most taxpayers will no longer itemize deductions, reducing the incentive to donate to 501(c)(3)s and rendering public-charity status less relevant to fundraising. Tax Cut and Jobs Act of 2017, Pub. L. No. 115-97, § 11021, 131 Stat. 2054, 2072-73 (codified in scattered sections of 26 U.S.C.) (increasing the standard deduction substantially for single and joint filers); see Joseph Rosenberg & Philip Stallworth, The House Tax Bill Is Not Very Charitable to Nonprofits, TAX POL’Y CTR. (Nov. 15, 2017), https://www.taxpolicycenter.org/taxvox/house-tax-bill-not-very-charitable-nonprofits [https://perma.cc/L9CS-5WXA] (predicting a substantial decline in itemized deductions). In addition, social-justice organizations have begun to question whether a 501(c)(3) model, and its required focus on litigation and courts over politics and grass-roots organizing, is capable of producing lasting social change, and have created new 501(c)(4) branches that can engage in political action. Pozen, supra note 81. Although the shift to 501(c)(4) “social-welfare” organizations might enable organizations to change their tactics, the change will not necessarily weaken the influence of elite donors on these organizations. Indeed, social-welfare organizations, like charitable nonprofits, are likely to derive much of their funding from elites. David S. Miller, Social Welfare Organizations as Grantmakers, 21 N.Y.U. J. LEGIS. & PUB. POL’Y 413, 417 (2018).
A dues model has the advantage of aligning an organization’s funding stream with basic commitments to democracy and self-governance. Organizations that are self-funded tend to be more accountable to their members, more democratically governed, and less at risk of a decline in funding due to changes in donor-giving patterns or foundation priorities. The labor movement, in particular, has achieved independence and relative financial stability through a dues model. Numerous grassroots-organizing groups have recently begun to experiment with dues systems in order to reduce their reliance on philanthropic donations.

In order for a dues model to sustain an organization, however, the Mancur Olson collective-action problem must be overcome. Absent a legal mechanism to mandate or facilitate dues, constituents are likely to free-ride, either for self-interested (albeit rational) reasons or simply because of the logistical difficulty of contributing. Indeed, low-income individuals who, in principle, are willing to pay to support their organization frequently cannot do so easily because of limited access to banking or formal financial services.

The most direct way to remedy the collective-action problem is through legal reforms that mandate contributions. However, a legal requirement that landlords transfer a mandatory tenant fee to a membership-based tenant organization, or that public-benefits providers transfer a mandatory recipient fee to welfare-rights organizations, would likely be deemed unconstitutional, even if tenants or beneficiaries were given the option not to become organization members. In Janus v. AFSCME, Council 31, the Supreme Court concluded that a public-sector employer cannot require that all workers covered by a collective-bargaining agreement pay an agency fee to a labor organization to cover the cost of collective bargaining and grievance handling; such payment constitutes impermissible compelled speech. Under Janus’s logic, a government requirement that individuals contribute to a representative housing, welfare-rights, or debtors organization would also likely violate the First Amendment.

253. See Fisk & Malin, supra note 222, at 1826-33.
254. See Strom, supra note 252, at 6 (describing dues efforts of such groups as National Domestic Workers Alliance, the Restaurant Opportunities Centers United, and Kentuckians for the Commonwealth, as well as other innovative mechanisms of fundraising by grassroots organizing groups).
255. Ashar & Fisk, supra note 244, at 182.
In separate articles, each of us has argued that the Janus majority’s First Amendment analysis is incorrect. But accepting the doctrine as binding, there are still several ways law can facilitate self-funding. First, the law could permit private entities and social-movement organizations to enter into contracts that require fees and that facilitate the fee transfers, as is permitted under the NLRA for private-sector employers and unions. For example, the law could enable membership-based tenant organizations of low-income renters to negotiate contracts with private landlords that require tenants to pay a small percentage of their monthly rent to their tenant organization in exchange for services provided by that organization. Because the state itself would not be compelling fees under this approach, state action would not be sufficient to trigger the First Amendment.

A second approach would be for the law to require private entities to facilitate the transfer of voluntary dues. This approach is unlikely to solve fully the collective-action problems discussed above. Comparative data on labor unions strongly suggest that voluntary dues, even when paired with services available only to members, result in a significant free-rider dynamic. But a facilitative model does vastly improve upon the status quo, solving some of the logistical hurdles that exist when organizations seek to fundraise internally. One promising example is the recently enacted New York City law that gives employees the option of deducting contributions to qualified nonprofit organizations that will advocate for nonunion workers; if employees exercise this option, the law requires employers to facilitate such transfers. Another example is the voluntary-dues campaigns that many unions have engaged in the aftermath of Janus, where unions obtain dues authorization and the public employer subsequently transfers money to the union. In order to ensure stability, many states allow

revocation of authorization only during designated windows. A similar model could facilitate transfers to tenant organizations, debtors’ unions, and organizations of public-benefits recipients. Finally, to encourage membership, organizations can combine the voluntary-dues model with provision of benefits and services, such as insurance, education, discount cards, and legal assistance; the National Rifle Association and the American Association of Retired People have both successfully used this approach. Indeed, government could empower organizations to serve as providers of social-welfare benefits, as in the Ghent system in Europe, where unions administer unemployment insurance, thereby providing organizations additional opportunities to recruit voluntary-dues payments.

To be sure, self-funding models are not a panacea, particularly when members can afford only minimal donations. Self-funding models can also have demobilizing effects, creating a transactional model in which members pay dues in exchange for services but do not engage in the broader movement work. Nonetheless, even movement organizations skeptical of a transactional-dues approach recognize that a membership-funding system helps safeguard against elite domination and, if combined with other organizational commitments, builds a more participatory and effective organization. The model should thus be one part of a multipronged approach to facilitating resource aggregation.

c. Cost-Shifting

A variation on a self-funding model would shift costs to the entity around which the social-movement organization is organizing. That is, the law could require those entities to pay for a portion of the organizing activity. For example, landlords of low-income residents could be required to contribute a small percentage of monthly gross rents to the representative tenant organizations.

263. See Fisk & Malin, supra note 222, at 1838–60.
266. See Ashar & Fisk, supra note 244, at 182–83 (reporting that dues requirements for worker-center members were thought to be “terribly onerous”); Cress & Snow, supra note 212, at 1094–1107 (demonstrating that for homeless social-movement organizations to be viable, external resources are essential, and explaining that homeless organizations have been particularly successful where their external funders were “social gospelite” organizations, not elites).
267. Ashar & Fisk, supra note 244, at 166, 183.
Public-benefits programs could contribute a small percentage of their budget to the representative welfare-rights organizations. Lenders could be required to contribute a percentage of profits to debtor organizations.

One problem with this approach is that, as applied to private payors, it would likely face constitutional challenge under the Supreme Court’s evolving compelled-speech doctrine.268 A potential alternative would permit social-movement organizations to bargain for such transfers without mandating them by law. Still, skeptics might worry that if a social-movement organization’s funding comes from one of its targets and opponents, the organization may be more likely to curb its tactics and demands.269 The organization could even become dependent on the entity with whom it negotiates and against whom it advocates. However, this concern can be mitigated by ensuring that only a portion of funds are from this stream and, to the extent constitutionally permitted, by making cost transfers mandatory by law, or bargained through arms-length transactions, rather than at the discretion of the funder.270

\textit{d. State Subsidies}

Another helpful (and constitutionally permissible) legal intervention would be to provide for government funding of social-movement organizations as a supplement to self-funding and charitable donations.271 Public funding has historically been an important part of social movements’ funding base. For example, since the 1960s, a large number of women’s movement groups have taken

on social-service functions in exchange for funding from the government.\textsuperscript{272} Also during the mid-1960s, as part of President Lyndon Johnson’s War on Poverty, Congress established the Community Action Program, charged with helping the poor develop “autonomous and self-managed organizations which are competent to exert political influence on behalf of their own self-interest.”\textsuperscript{273} Government-funded Community Action Agencies (CAA) recruited “issue-oriented community organizers” and provided “financial assistance to indigenous community organizations.”\textsuperscript{274} More recently, worker centers representing low-wage workers have “collaborat[ed] with government agencies, particularly on enforcement campaigns in progressive jurisdictions with expansive, but under-enforced legal protections for workers,” which has “generated . . . financial support” for the centers “in the form of government grants to facilitate investigation and enforcement . . . and training in know-your-rights programs.”\textsuperscript{275}

A challenge is that state subsidies usually come with strings attached. Thus, an organization “seeking affirmative state assistance invites a political debate over whether or not much such assistance is justified” and “about the conditions

\textsuperscript{272} See Myra Marx Ferree & Patricia Yancey Martin, Doing the Work of the Movement: Feminist Organizations, in Feminist Organizations: Harvest of the New Women’s Movement 19, 21 (Myra Marx Ferree & Patricia Yancey Martin eds., 1995) (discussing the impact on select feminist organizations of receiving funding from the government).

that should be attached to the assistance.”276 This debate is one worth having and should become less burdensome as mass-membership organizations grow. Moreover, while relying exclusively on state funding would leave organizations vulnerable to changes in the political climate, state funding can be one important part of a mixed-funding regime and can help serve as “seed” money while organizations build their indigenous funding. Improving upon past efforts, state funding could be targeted to organizations that meet particular criteria. For example, grants could take into account organizational mission, leadership-development practices, and whether the organization is governed by members, federated in structure, and inclusive.277

2. Physical and Virtual Spaces

In addition to funding, physical and virtual spaces for organizing are essential to the success of mass-membership organizations. As Daniel Cress and David Snow write, “A regular place to meet and adequate supplies are requisites for doing regular organizational business.”278 They quote a supporter of the Detroit Union of the Homeless, who observes that “[t]here is a kind of franticness when you don’t really have a place where you can invite anybody into. But when you do, people can find you. Strategies can be developed. You can get a sense of your own identity.”279

Sociologists have demonstrated that natural gathering spaces, where people are in close proximity, are the most fruitful locations for social-movement building.280 Yet many of the spaces in which poor people naturally congregate are controlled not by those people themselves, nor by their social-movement organizations, but rather by governmental or corporate entities. Providing access to these

spaces can be particularly helpful for organization building: access communicates acquisition and control of a space in which poor and working people typically have little authority and thereby helps legitimize the social-movement organization.\textsuperscript{281}

In the contemporary era, the availability of digital—that is, internet-based—“space” can be just as important as the availability of physical space. In the labor context, for instance, workers often no longer share a common workplace and thus simply have no shared physical space in which to congregate, discuss, and organize. The same is true for debtors, who may live dispersed across the entire nation and for whom no feasible central physical meeting location exists.\textsuperscript{282} In these settings, access to email, text, social media, and other “digital meeting spaces” can be critical,\textsuperscript{283} and, in fact, access to such digital resources for organizing purposes is a hotly contested question in NLRB law.\textsuperscript{284} This is true for the simple reason that digital resources can be powerful substitutes for physical spaces. Take, for example, the recent Google walkouts—protest actions engaged in by workers across the globe whose only contact with one another was through online forums and tools.\textsuperscript{285} It is also the case that teachers involved in organizing the RedforEd movement gathered on a Facebook page, as well as in person.\textsuperscript{286}

Indeed, digital spaces can be important to organizing even where physical space is available, especially in contexts where meeting online is more practicable.

or advantageous than gathering together in a single physical location. This principle has been most apparent in the era of COVID-19, when the need for social distancing means that in-person meetings, especially large ones, are a public-health threat. Unions are recommending that workers who can no longer organize in person gather on Zoom instead. And tenant activists are turning to the internet to organize rent protests and strikes during the economic crisis that the pandemic has produced. According to one organizer, “If you’re bringing new people into your movement right now, you’re doing it online.”

The potential for legal intervention to provide access to both physical and digital spaces is significant. The law could provide a legal right for both paid organizers and organization members to access the relevant constituency groups in person and online. It could grant the right to come onto employer property, to enter building lobbies and common areas, and to hold meetings in welfare centers. The law could also provide access to digital meeting spaces, requiring employers, landlords, benefit providers, and lenders to provide digital resources to workers, tenants, benefit recipients, and borrowers for organizing purposes. We discuss some of these options in more detail below when we take up the need for “free” associative spaces.

3. Information

Another critical resource for social-movement organizations is information, particularly information about the organization’s constituency. Organizers need to know who the relevant constituency is and where they can be contacted: Who are the workers in a given firm, the tenants in a given building, or the recipients of a given welfare benefit?

The NLRA again provides a partial model. It requires employers to provide an *Excelsior* list of bargaining-unit members to a union that makes a showing of employee interest in being represented by that union.293 The list includes both names and contact information. Similar informational rights exist under several states’ public-sector bargaining systems, requiring, for example, that unions be notified when new members join the bargaining unit and afforded the opportunity to meet with new unit members (on the clock).294 Statutes could create parallel rights for tenant organizations, debtor organizations, public-benefits organizations, and so on.

In addition to information about the constituency, organizations also need information about the broader political and economic context in which they are organizing. To some extent, the internet has made such information more accessible, facilitating movement activity.295 Yet, much information remains proprietary and inaccessible to workers, tenants, debtors, welfare beneficiaries, and their social-movement organizations. For example, a recent study found that only four percent of workers have access to information about compensation of senior executives, managers, supervisors, and colleagues, as well as information about how well their organization is doing.296

Here, legal intervention could again be valuable. Law could require the disclosure of relevant information about the relevant entity, industry, or program to inform the strategic work of the social-movement organization. For example, the NLRA has been interpreted to require that employers provide information to unions about their finances to the extent such information is relevant to the employer’s bargaining positions.297 Law could impose similar obligations in the context of housing, public benefits, and education debt. Or, even better, it could require more expansive disclosure that does not hinge on bargaining positions or organizational requests. Washington, D.C.’s tenant law provides a partial model: it provides tenant organizations the right to information about new

---

development and the right to an appraisal during any sale process.\textsuperscript{298} Ultimately, disclosure of information is critical not only to engaging with the private entity but also to social-movement organizations’ engaging in the political process in an informed way.

4. Human Resources

A final category of resources that is essential to organization success is human resources—including labor, leadership, and expertise.\textsuperscript{299} Yet a movement’s ability to deploy human resources is limited by the time and skill available to its constituents. Poor and working-class people tend to have less leisure time to donate to organizations; they also frequently have fewer technical skills to provide (though no less potential).\textsuperscript{300}

Here too, law could make a significant difference. It could guarantee paid time off for individuals to participate in the organization and to attend leadership or technical training, possibly reimbursing employers, or allowing them to deduct from taxes the amount of wages they pay to people for participation. Jury-duty laws provide one model. Eight states require an employer to pay employees while serving on jury duty.\textsuperscript{301} Labor law also provides some examples. Under numerous private collective-bargaining agreements and under several public-sector labor-relations statutes, employees are permitted to perform organization functions on official time (i.e., release time with pay from their regular duties).

The Federal Service Labor-Management Relations Statute, for example, requires that union representatives who are also employees of the agency be granted

\textsuperscript{300} A significant literature in sociology examines the importance of both leadership development and rank-and-file militancy and participation in poor people’s organizations. We recognize that the legal interventions we propose do little to build leadership or rank-and-file militancy directly beyond creating the time and funds for development. That is not because we believe those goals are unimportant but rather because we are skeptical the law has much to offer.

The precise design of a release-time requirement would vary depending on the context. For example, a tenant-related law could require unpaid release time for workers to participate in tenant-organizing efforts and in training programs, with the member able to recoup lost wages up to a designated amount from the landlord. In the public-benefits context, to the extent states require public-benefits recipients to work, labor performed for movement organizations could count as qualified work.\footnote{Cf. Noah D. Zatz, Get to Work or Go to Jail: State Violence and the Racialized Production of Precarious Work, 45 LAW & SOC. INQUIRY 304, 328-30 (2020) (addressing the coercive nature of state-mandated work).}

C. Free Spaces

Another prominent strand of social-movement theory suggests that successful political organizing depends on the availability of “free spaces” open to and suitable for organizational work.\footnote{See SARA M. EVANS & HARRY C. BOYTE, FREE SPACES: THE SOURCES OF DEMOCRATIC CHANGE IN AMERICA 18 (1986) (“Democratic action depends upon these free spaces, where people experience a schooling in citizenship and learn a vision of the common good in the course of struggling for change.”).} The literature takes a capacious view of what such spaces may consist of, and it includes discussion of both literal physical

spaces—for example, churches, mosques, student dormitories, and union halls—but also more abstract figurative spaces including linguistic codes and artistic performance. Despite the breadth of concepts encompassed in the definition of free space, however, there is some agreement on core elements of the definition. In summarizing work on the question, for example, Rick Fantasia and Eric L. Hirsch conclude that “[o]n the most basic level” free spaces are

meeting places where communication can be facilitated without deference to those in power, representing “liberated zones” to which people can retreat, spatial “preserves” where oppositional culture and group solidarity can be nourished, tested, and protected. It is in such relatively “free” social spaces that members of subordinate groups discover their common problems, construct a collective definition of the sources of their oppression, and note the limits of routine means of redressing grievances, where collective identity and solidarity are cultivated in practices, values, and social relations.

Similarly, William A. Gamson writes that free spaces are “limited access public spaces that permit the development of an oppositional culture.” And Francesca Polletta, although critical of aspects of the free-space literature, concludes that there is broad agreement among scholars that in identifying the unifying characteristic of a free space, “freedom from the surveillance of authorities is essential.” In sum, then, the free-space literature suggests that political organizing requires space in which groups can assemble to discuss their grievances and

develop their objectives and in which they are free of interference from those in power who would oppose their organizational efforts.

The theoretical work on free space is complimented by historical analysis of the role that such spaces have played in social-movement mobilization. Perhaps the central animating example is the role played by Black churches, both in the struggle against slavery and in the Civil Rights movement. Thus, Sara M. Evans and Harry C. Boyte write that successful political mobilization requires "community places . . . where [movement participants] can think and talk and socialize, removed from the scrutiny and control of those who hold power over their lives. The black church especially has played this crucial role as a free space in black history."316 Aldon D. Morris, in examining the origins of the Civil Rights movement, observes that the church played a central role by providing "a safe environment in which to hold political meetings"317 and "an institutional alternative to, and an escape from, the racism and hostility of the larger society. Behind the church doors was a friendly and warm environment where Black people could be temporarily at peace with themselves while displaying their talents and aspirations before an empathetic audience."318 Gamson, summarizing Morris's historical work, put it more bluntly: "Morris shows the centrality of the Black churches in the building of the Southern civil rights movement . . . [T]hey provided a place where Blacks could assemble without whites being present."319

Critically, and obviously, the church was more than a "space" for organizational activity: it was, among other things, a rich source of spiritual tradition, deep community ties, and leadership. The point here is simply that the church played a crucial role by providing a free space for political organizing.

Similar to the church's role as a safe space for civil-rights organizing, Fantasia and Hirsch document the role played by the mosque—and the Casbah—in Algerian resistance to French colonization.320 Dingxin Zhao writes about the importance of the physical structure of Beijing university campuses to the mobilization of students during the 1989 democracy movement, noting that "the existence of campus walls"—which separated student living space from the public road system—"was important for the development of the movement," and concluding that "the simple existence of walls . . . created a low-risk environment and facilitated student mobilization."321 And Hirsch stresses the importance of so-called Turner halls as "havens where the Chicago working class . . . could

develop their politics in relative isolation from the intrusions of the city’s political and business elite.” 322

Of course, the existence of free spaces is neither necessary nor sufficient for political organization. To state the obvious, much more is required for successful political organizing than a physical location for meetings free of surveillance. 323 But the literature provides a solid basis for concluding that the presence of free spaces can be an important contributing factor to the success of political-organizing efforts.

Accordingly, the question for us is what the law might plausibly do to facilitate the creation of free spaces for political organizing. We see two basic categories of possible interventions: (1) the provision of space and (2) prohibitions on surveillance. Labor law, again, provides an incomplete but important model for these types of intervention. Under the rules set out in the Supreme Court’s Republic Aviation opinion, employers must allow employees to discuss unionization efforts in the workplace, so long as those discussions occur during nonworking time. 324 Moreover, in certain narrow circumstances—in fact, extremely narrow circumstances under current law—employers must allow nonemployee union organizers to access company property for the purpose of discussing union organizing with employees. 325 Coupled with these grants of rights to use employer property for organizational purposes is a ban on employer surveillance of employee-organizing activity. Thus, “[s]ince the earliest days of the Act, surveillance of employees by an employer, whether with supervisors, rank-and-file employees, or outsiders, has consistently been held to” constitute an unfair labor practice. 326 Accordingly, federal labor law creates a legal requirement that

322. Hirsch, supra note 310, at 159 (emphasis omitted). In the contemporary context, the internet may also provide opportunities for the construction of free spaces for organizational development. For example, Rosemary Clark-Parsons studied Girl Army—a Philadelphia-based feminist group—which used a closed Facebook group (one open only to Facebook users invited by current members of the organization and approved by one of six moderators) in an attempt to construct a space safe for political discourse. Rosemary Clark-Parsons, Building a Digital Girl Army: The Cultivation of Feminist Safe Spaces Online, 20 New Media & Soc’y 2125, 2128-31 (2018).

James Tracy notes, for example, that certain elements of the radical pacifist movement during World War II emerged from organizing done inside federal prisons. See James Tracy, Direct Action: Radical Pacifism from the Union Eight to the Chicago Seven 3 (1996).

325. See Lechmere, Inc. v. NLRB, 502 U.S. 527, 539 (1992) (discussing an exception to the general rule restricting nonemployee access “wherever nontrespassory access to employees may be cumbersome or less-than-ideally effective,” which has been interpreted narrowly).

employers cede part of their property rights to the organizational efforts of their workers and prohibits employers from engaging in surveillance of those efforts. Still, “only slightly over half of workers report having access to physical spaces” to meet with other workers (let alone organizers), “and access is more likely for higher-income and more highly educated workers.”

Building on the partial precedent provided by labor law, a law of political organizing could require the provision of space within the property of the dominant party. As the above discussion anticipates, moreover, this might be space within the physical property of the dominant party, or it might be “space” within the digital resources of the dominant party. Thus, for example, tenants and tenant organizations could be entitled to access space within buildings where they are organizing, or have organized, tenants. Public-benefits recipients could be provided space in welfare centers. Workers and their organizations—in an expansion of current rights—could be entitled to space on company property. Similarly, the law could mandate that employers, landlords, lenders, or welfare agencies provide workers, tenants, debtors, and benefits recipients the right to use the dominant party’s online resources (such as email lists, websites, and chat rooms) for organizing purposes. In addition, or alternatively, the law could require the creation of public spaces—political meeting halls, essentially—funded by tax dollars and made available to political organizations for organizational purposes. Here, again, the public spaces could be physical or digital. Finally, the law might subsidize the cost of procuring such space on the private market: political organizations could receive tax credits for reasonable costs incurred in securing space for organizational efforts.

It is worth noting that there are costs and benefits to each of these approaches. With respect to a legal requirement that organizations be granted space within the property—physical or digital—of the targets of their organizational activity, the downside is that preventing surveillance may be more

328. Indeed, a few localities already provide some access rights for tenant organizers. For example, Washington, D.C. provides tenant organizers the right to canvass in multifamily housing. D.C. CODE § 42-3505.06(b)-(c) (2020). For a discussion of tenant-organizing laws, see Christopher Bangs, Note, A Union for All: Collective Associations Outside the Workplace, 26 GEO. J. ON POVERTY L. & POL’Y 47 (2018). Access rights, however, raise various First Amendment issues. See, e.g., Perry Educ. Ass’n v. Perry Local Educators’ Ass’n, 460 U.S. 37, 44-54 (1983) (allowing the teachers’ union exclusive-bargaining representative access to teacher mailboxes and the interschool mail system, rejecting that such access violated a rival union’s rights under the First Amendment, and holding that the access granted to the exclusive bargaining representative was reasonable because it enabled the union to perform its obligation to represent all of the district’s teachers).
difficult. Moreover, even absent actual surveillance, participants may be more wary of surveillance in these settings and thus, whether or not they are actually being surveilled, feel less free to “question the rationalizing ideologies of the dominant order”\textsuperscript{329} and organize. On the other hand, there can be significant symbolic value in allowing organizing to take place on the physical property or the digital resources of the opposition. For one thing, such access signals to participants that the organizations in question are not outsiders to the relationship around which organizing is taking place: for example, a worker organization that meets in a company break room—or a company chat room or listserv—can come to seem a more natural part of the work relationship than one that meets only off-site in a union hall. More important from an organizing perspective, granting on-site space to organizations can signal the vulnerability of the opposing party in a way that can be critical to success.

The political-process model of social-movement emergence helps illuminate this point.\textsuperscript{330} As Doug McAdam shows, successful collective action—in our context, successful political organizing—depends on, among other things, the “collective assessment [by participants] of the prospects for successful insurgency.”\textsuperscript{331} This assessment, in turn, depends on participants holding two interrelated views: first, they must believe that the organizations they are forming have the potential to exercise effective power, and, second, they must believe that the status quo—the forces they are contesting—are “vulnerable to challenge.”\textsuperscript{332} This perception of vulnerability is accordingly a prerequisite to successful organizing. The point makes intuitive sense. If participants believe that the current regime is invincible, they are unlikely to participate in an organizing campaign designed to change those conditions. On the other hand, if individuals can be shown that the current structure is subject to challenge—that it is vulnerable to the efforts of an organized opposition—then participation becomes more plausible. As Francis Fox Piven and Richard Cloward put it, “The social arrangements that are ordinarily perceived [to be] . . . immutable must come to seem . . . mutable.”\textsuperscript{333}

The employer’s control over the workplace, like the landlord’s control over the building, can be an important means for communicating power and thus for signaling to workers and tenants that neither the employer nor the landlord is vulnerable to challenge. This suggests, however, that by enabling organizers to

\textsuperscript{329}. Fantasia & Hirsch, \textit{supra} note 308, at 145.

access workplaces and buildings, the law can disrupt these projections of invincibility and communicate that employers and landlords may in fact be vulnerable to challenge. As one of us explained previously,

As vigorous as employers are when it comes to attempts to prohibit their own employees from talking union at work, they are even more adamant when it comes to the ability of full-time union organizers to come onto employer property to discuss unionization. . . . This opposition stems in part from the fact that physical presence of union organizers on company property marks a major incursion into the employer’s control over the workplace. Excluding union organizers thus reinforces a perception of employer control. By the same token, a legal requirement that employers admit union organizers conveys to workers management’s susceptibility to the law of union organizing.334

Indeed, a classic scene from the film Norma Rae captured this dynamic cinematically. At the outset of that movie—which involved a union-organizing drive at a textile mill in the southern United States—the union organizer is barred from the factory by a locked, barbed-wire fence. This exercise of employer property rights clearly conveys employer power and dominance vis-à-vis the union. But later in the film, the organizer is permitted—through the operation of a contempt sanction imposed under federal labor law—to walk through the factory in order to inspect a company bulletin board. The scene of a union representative physically present in what had previously been a site of unchallenged employer authority communicates to workers on the shop floor a new sense that perhaps the employer is vulnerable to union challenge.335

Thus, because perceptions of vulnerability can contribute to the success of organizing efforts, a legal requirement that organizations be granted on-site “free spaces” has significant virtue. But whether organizing space is granted on-site or off, a note is in order about the challenges of making sure such space is genuinely free—the challenges of preventing surveillance in the modern era. Much of the free-space literature examines social-movement development that occurred prior to the proliferation of smartphone, internet, and modern surveillance technology. Although, of course, state actors possessed electronic-surveillance capabilities during the Civil Rights era, those technologies were relatively less available to nonstate actors like employers and landlords. This is no longer the case. The proliferation of cybertechnology means that nongovernment actors—including employers and landlords—have access to affordable means for surveilling challengers, should they wish to do so. In today’s environment, an

employer or landlord could purchase a device that looks like a cockroach or a dragonfly and provides high-quality video and audio recordings of any organizing meeting. Surveillance capabilities are certainly as great in cyberspace and thus the challenge of ensuring surveillance-free digital organizing is also a daunting one.

For our purposes, this means that if the legal regime is to provide free space for political organizing it must also protect against sophisticated forms of surveillance. At a minimum, the law should establish meaningful sanctions for any type of surveillance carried out against political-organizing efforts. These sanctions should include punitive damages. Beyond sanctions, the law also could provide for public funding of antisurveillance technologies, either through direct provision or tax credits for organizations that incur reasonable expenses purchasing such technologies.

D. Removing Barriers to Participation

Legal reforms to facilitate aggregation of resources and access to spaces are essential, but they are not sufficient to enable organization building among vulnerable populations. As sociologists have documented, a movement organization’s vitality and longevity are dependent on its ability to attract and retain members. Yet, even when participants are motivated and sufficient resources exist, several barriers to recruitment and retention remain.

A chief obstacle for many individuals is fear of reprisal. As sociologists have demonstrated, fear of retaliation can jeopardize collective action, particularly in high-risk environments. Among low-income populations, the risk is high. For workers, tenants, debtors, and benefit recipients, retaliation might mean the loss of livelihoods, shelter, future creditworthiness, and emergency support.

Retaliation and repression do not always defeat organization. Movement identity, solidarity, and social bonds can help individuals resist and challenge authority. Rick Fantasia, for example, illuminates how organizing and strikes foster a culture of solidarity that makes it possible for workers to persist, even in

the face of antiunion campaigning, intimidation, and arrests. 339 Jeff Goodwin and Steven Pfaff show that intimate social networks, mass meetings, collective identities, shaming, and appeals to divine protection all helped mitigate fears of police repression and encouraged movement participation during both the Civil Rights movement and the East German Opposition movement. 340 At the same time, the literature highlights the extent to which repressive action by state and private actors frequently prevails, impeding successful organizing and even leading to organizational collapse. 341

A second barrier to joining and remaining part of a movement organization is life responsibility, which can render people, in sociologist Sharon Nepstad’s terms, “biographically unavailable.” 342 Numerous sociologists observe that full-time employment, family obligations, lack of transportation, and other material obstacles can pose significant barriers to movement participation. 343 Some individuals overcome these barriers because of deep motivation and allegiance to the cause or because of connections to other organization members. 344 Yet, sociologists have demonstrated that overcoming barriers need not only be a personal, individual-level effort. Some social movements have had success by providing material assistance and family support so that members are free to participate. Nepstad, for example, has documented how the Catholic Left Plowshares

movement provided stable childcare so protesters could go to prison if needed; the organization also provided housing, legal support, transportation, and other assistance.345

Law may not be able to increase individual motivation, build social networks, or foster solidarity, but it can help remove barriers to participation—both by protecting those engaged in organizing work from retaliation and by removing material obstacles to participation.

First and foremost, the law must protect all those involved in organizing efforts from retaliation: no worker may be fired, no tenant evicted, and no welfare recipient deprived of benefits because they are active in or supportive of the organization’s efforts. Penalties and enforcement mechanisms must be strong enough to deter violations of law. Indeed, several regimes protect organizing rights, including the NLRA and several states’ tenant laws, but lack sufficient penalties or enforcement mechanisms to ensure consistent compliance.346 Private rights of action, compensatory and punitive damages, class relief, prohibitions on mandatory arbitration, and other strong remedies are necessary to truly remove this barrier to participation.347

In addition, the law could provide just-cause protections. Under this model, no worker could be fired, no tenant evicted, no welfare recipient deprived of benefits without the employer, landlord, or benefit provider demonstrating just cause.348 The victim would not need to show antiorganizing animus or that opposition to organization was a motivating factor in the adverse action. The advantage of this approach is that it could create a more secure environment, shifting the burden to the authority figure when a dispute about retaliation exists. Yet, even just-cause provisions are no panacea. General due-process protections

already exist in several of these areas—in public benefits, for example—and power dynamics still create fear of reprisal. Antiretaliation and just-cause protections, while helpful, must be part of a broader regime enabling organizing.

To that end, law should also work to remove material barriers. Here, the literature on resources is again instructive. As discussed above, the law could require paid time off from work; it could also provide subsidized childcare or other material support for participation in qualified organization activities.

E. Material Changes, Incremental Victories, and Structural Power

Another facilitator of organizing success is success itself. That is, the ability of people to build powerful organizations depends on their ability, first, to win smaller-scale, incremental victories along the way, and, second, to operate in structures that enable meaningful large-scale victories.

The origins of the insight about incremental victories can be traced to Saul Alinsky, a community organizer and author of *Rules for Radicals*. In that book, Alinsky lays out a program for building mass political organizations based on his own experience as an organizer and educator. Alinsky stresses the importance of winning small-scale victories this way:

> The organizer knows . . . that his biggest job is to give the people the feeling that they can do something, that while they may accept the idea that organization means power, they have to experience this idea in action. The organizer’s job is to begin to build confidence and hope in the idea of organization and thus in the people themselves: to win limited victories, each of which will build confidence and the feeling that “if we can do so much with what we have now just think what we will be able to do when we get big and strong.”

Alinsky’s thesis is borne out by both sociological accounts of organizing campaigns and the theoretical literature on collective efficacy. Thus, for example, in his seminal study of the union campaign at Springfield Hospital, Rick Fantasia reports that workers’ successful engagement in what he calls “mini-insurrections”—small-scale collective actions—increased the likelihood that they would

participate in more full-scale union organizing efforts. Fantasia concludes that workers gained a “courageousness” from their experience with small-scale organizing success and that this courageousness was a “crucial component of union formation, especially in the face of sharp employer resistance.” Similarly, in her study of the contemporary labor movement, Rachel Meyer concludes that organizers can increase the prospects for ultimate success by making it “possible for people to first succeed at small collective actions so that they become aware of their power to make change.”

The theoretical literature on efficacy also confirms Alinsky’s insight. This literature suggests that people decide what actions to take in the face of obstacles based on perceptions of their efficacy in overcoming those obstacles. Crucially, according to Albert Bandura’s work, people learn to assess their efficacy based on past experiences: when we succeed at one task, we come to believe that we are capable of performing similar, but more difficult, tasks in the future. Thus, “partial mastery experiences” facilitate “subsequent performance of threatening tasks that [one has] never done before.” This form of “efficacy learning,” moreover, applies at both the individual and the collective levels, suggesting that participation in successful collective endeavors—however modest—increases the prospects for participation in more robust forms of collective activity.

What might the law do to facilitate efficacy learning in organizing? In a sense, all of our recommendations further this goal. After all, all of our recommendations are geared to increase the likelihood of organizational success, and thus all will hopefully make it more likely for participants to experience the kind of victories that fuel further organizing. But there are specific things law might do to make early-stage, tangible, and small-scale organizing victories possible.

First, the law can make small-scale tangible gains more likely by imposing bargaining obligations in each of our areas of focus. Thus, landlords could be legally required to bargain with tenants’ unions, welfare agencies with benefit-recipient unions, and employers with workers’ unions. The scope of the obligation should be crafted explicitly to allow unions to bargain for a wide range of

357. See Albert Bandura, Self-Efficacy: The Exercise of Control 478 (1997) (stating that “efficacy beliefs have similar sources, serve similar functions, and operate through similar processes” and that perceptions of self-efficacy “affect how well group members work together and how much they accomplish collectively”).
goals. Thus, in the tenant context, the obligation could cover rent, terms of eviction, environmental standards, and the like, but it could also require landlords to bargain over details that tenants would find meaningful if not transformational. Similarly, in the labor context, the obligation should enable workers’ organizations to bargain over wages, hours, and working conditions, but also over other aspects of the work relationship that matter to the workers—say, the availability of a water cooler or a coffee station.

This suggestion tracks, in part, the current obligation to bargain in good faith that federal labor law imposes on employers when a union represents that employer’s employees. Unfortunately, the NLRA’s good-faith requirement has proven insufficient as a means of encouraging the parties to reach actual agreement. Thus, a law designed to facilitate small-scale victories might need to go further than this requirement. The suggestions contained in this Article aimed at strengthening the right to protest and strike are one avenue to explore. Another direction worth considering would be to couple the bargaining obligation with the so-called “interest arbitration” of first agreements. Under an interest-arbitration procedure, the parties would attempt to conclude negotiations of a first agreement, but in the event they are not successful, the dispute would be resolved by a neutral arbitrator who could shape the contours of the first agreement. This process would thus help ensure that some gains for tenants, benefit recipients, or workers emerged from the bargaining process. The magnitude of those gains would depend on how much power the union had built, but since the goal is to enable participants to have a first experience with organizing success, the fact of progress matters more than the degree of it.

While incremental small-scale victories are essential, a system designed to build countervailing political power among organizations of the poor and working class must also create structures that enable those groups to exercise effective economic and political power. Thus, the scope of the bargaining obligation ought to be crafted to track the relevant economic and political system in which the organizations operate. In the labor context, this approach would mean that bargaining would be required to occur at a sectoral level in addition to the

worksite level, and with entities that exercise financial power in a given industry or over a given supply chain, as well as with direct employers. \textsuperscript{361} For student debtors, for example, bargaining would be required with for-profit colleges with exploitative debt practices, lenders, and government regulators. \textsuperscript{362} And the topics of bargaining would not be limited by law to exclude, for example, entrepreneurial issues or broader political concerns; instead, these conditions would be reworked to allow organizations to bargain expansively and for the “common good.”

A related type of legal intervention would grant policymaking power to organizations of poor and working-class Americans through administrative processes at the local, state, or federal levels of government. \textsuperscript{363} Beyond simply encouraging group participation, the law could give organizations the right to appoint representatives to public administrative bodies based on membership levels relative to the constituency as a whole. For example, housing law could require that housing authorities or rent-control boards add seats for each tenant union that meets a certain threshold number of members. The tenant union’s membership would then be entitled to elect a representative to the new seat. And labor law could require that workers’ compensation boards and occupational-health boards include members from unions that reach a certain density. Federal, state, or local government could also facilitate sectoral and regional bargaining using a tripartite approach, enabling worker organizations and employer

organizations—or tenant organizations and landlord organizations, debtors and banks—to establish employment conditions—or housing or lending standards—jointly throughout a given sector, subject to governmental oversight as required by constitutional delegation and due-process doctrines.364

Such administrative mechanisms would provide organizations concrete power in policymaking. To the extent the law conditioned participation on membership levels, it might also have the effect of encouraging organizations to establish federated membership structures in ways that enhance their long-term ability to exercise political power.365 Moreover, in providing meaningful interim victories, such processes could contribute to members’ sense of collective efficacy and thus to further organizing.366

F. Contestation and Disruption

Almost everyone agrees that when a political system offers a nondisruptive means for accomplishing change, such methods are preferable. In theory, the American pluralist system implies that everyone can engage through nondisruptive means. But a substantial body of sociology work suggests that a degree of disruption is necessary for movement success, particularly among poor people. As William A. Gamson observes, “Unruly groups, those that use violence, strikes, and other constraints, have better than average success” at achieving the movement’s goals.367 Charles Tilly has reached similar conclusions, studying movement actions dating back to food riots in Burgundy, France in the seventeenth century. Tilly explains that repertoires of contention vary depending on legal and social context—ranging from tax revolts to strikes to mass public meetings—but his study underlines the importance of contention over time and

365. See SKOCPOL, supra note 50, at 92-93 (discussing the importance of federated membership organizations in a federal political system).

366. Government-authorized service provision, discussed in Section III.B.1, also has been shown to build organization. By providing critical services and benefits, such as unemployment insurance, organizations build connections with members while also demonstrating efficacy and value. across contexts. In work studying the Civil Rights movement, Doug McAdam similarly finds that movement success depended on disruptive tactics, though he finds that the most effective forms of disruption were temporary and involved constant innovation to respond to segregationist reprisals.

In perhaps the most famous study of poor people’s movements, Frances Fox Piven and Richard Cloward highlight how insurgent and defiant action is critical to movement success. Protest takes different forms depending on institutional context and the ways in which individuals can withhold cooperation or services—workers can withhold labor, and tenants can withhold rent, whereas the unemployed must sometimes occupy workplaces and demonstrate en masse. Protest is more likely to be effective if three conditions exist: (1) Protestors are central to institutions’ functioning; (2) Powerful groups have a stake in those institutions; and (3) Protesters are able to protect themselves from reprisal.

Research from historians and political scientists confirms the account offered in the sociological literature about the role of disruptive action in movement success. From the early- and mid-twentieth-century industrial-worker strikes and rent strikes to the 1960s student movements and civil-rights protests and boycotts, disruptive concerted action has been critical to movement success. Contemporary examples tell a similar story. In the spring of 2012, for example, hundreds of thousands of students in Quebec protested a proposed seventy-five percent increase in tuition at public universities. Organized by their student unions, over 300,000 students went on strike, with several hundred thousand

370. See generally PIVEN & CLOWARD, supra note 41 (examining protest movements among the poor and working class in the United States in the middle of the twentieth century). According to Piven and Cloward, the hope for poor people’s movements lies primarily in moments when large-scale changes undermine political stability, and the poor engage in insurgency. Following such protest, concessions are often withdrawn, but some become permanent. Id. at 34-35. This phenomenon does not mean, however, that formal organization is antithetical to movement success or that protest is the only means to achieve movement goals. Rather, there is a contingent relationship between protest politics and conventional political engagement. See Sanford F. Schram, The Praxis of Poor People’s Movements: Strategy and Theory in Dissensus Politics, 1 PERSP. ON POL. 715, 716-18 (2003).

Thus, poor people are in a weaker position to use disruption as a tactic for influence because they frequently do not perform roles on which major institutions depend, or those who manage their institutions often have little to concede. remaining on strike for months. By September, the government abandoned its proposed increase. In Los Angeles, in recent years, incidents of tenant rent strikes have increased in the face of rising rents and deplorable housing conditions, with tenants, organized by the Los Angeles tenants’ union, winning some significant victories in both local policy and private rent arrangements. Meanwhile, in the last few years, hundreds of thousands of public-school teachers in the United States have engaged in mass strikes, winning substantial improvements in salaries, benefits, and education funding even in states with Republican legislatures and no formal union rights. During the COVID-19 pandemic, strikes by essential workers at Amazon, Whole Foods, Target, FedEx, and elsewhere, and protests by nurses and other healthcare workers, forced attention to urgent health and safety concerns.

Law can facilitate effective protest through several mechanisms. First, it can affirmatively provide the right to strike across domains. That is, law can and should explicitly grant the right of workers, tenants, and public beneficiaries to engage in concerted action, including protests and strikes. Simply creating a right is not enough, however. Second, law must also provide protection from both private and state reprisal—and protection must be meaningful and broad in scope. Thus, the law must not only prohibit employers from firing workers for striking (as private-sector labor law does, but much public-sector law does not); it also must prohibit permanent replacement of those who strike and

374. See Bangs, supra note 328, at 48.

provide strong penalties and enforcement mechanisms.\(^\text{378}\) Similarly, the law must prohibit tenants from being evicted or harassed and beneficiaries from being cut off or having their benefits reduced.

Third, the law must protect the right to engage in effective concerted action, even when such action is disruptive. For example, the law should not only provide workers at a single employer the right to strike and to demonstrate peacefully in front of their employer, nor should it only provide tenants the right to protest their particular landlord. Rather, and in contrast to current labor law, the law could also offer some protection for secondary boycotts and sympathy strikes across multiple domains, and it could permit nontraditional strikes short of full or indefinite stoppages.\(^\text{379}\) To be sure, limits ought to exist on the right to engage in disruptive protest. Protests must be peaceful, eschewing both destruction of property and violence against individuals. But the right to protest becomes ineffective if it is cabined to prevent disruption.

Finally, the law should protect protests and strikes that have the political process as a target and the “common good” as a goal.\(^\text{380}\) Current labor law achieves this to a point: the Supreme Court has held that the NLRA protects workers’ concerted activity that occurs through political channels, but only insofar as the activity relates to employment issues.\(^\text{381}\) The NLRB has also concluded that workers may not be protected if they strike for an exclusively political cause.\(^\text{382}\) Despite these restrictions—and others present in public-sector labor law—workers have frequently struck to advance the common good and to influence political decisionmaking. Consider the 2019 Chicago Teachers’ strike, during which teachers demanded not only better wages and benefits and smaller class sizes, but also housing assistance for new teachers, staff to help students and families in danger of losing housing, and other steps to advance affordable housing in

A law designed to reduce political inequality would grant protection to this kind of collective action.

For many, the preceding recommendations regarding strikes will be controversial, if not entirely objectionable. In a liberal society, traditional paths of political power—voting, lobbying, participation—remain preferred. Our recommendations aim to strengthen those channels and to make disruption and contestation less likely. But history and social-science research leaves little doubt that disruptive concerted action is also essential for working-class and poor people to have a reasonable chance of success at achieving a redistribution in political (and economic) power. \footnote{When law creates and empowers organizations, it also typically imposes duties and constraints on those organizations. Corporate law imposes duties of care, loyalty, and faith, as well as disclosure obligations. Charitable nonprofits operate under various disclosure and governance obligations; they are also constrained from engaging in political activity. Labor law imposes a duty of fair representation on unions, as well as significant disclosure requirements; obligations of democratic governance and nondiscrimination; restrictions on expression; and an obligation of independence from the employer, in what Cynthia Estlund has termed a quid pro quo. Estlund, supra note 153, at 171-77, 193-234.}

\textbf{CONCLUSION}

Skeptics will object that none of this is possible. If elites wield so much power in the political sphere, why would they ever permit reforms that would

\footnote{A discussion of what duties law should impose on newly empowered social-movement organizations is beyond the scope of this Article. Different contexts will warrant different specific designs, and the question of constraints and duties implicates a vast body of organizational literature and difficult choices. But, at the very least, social-movement organizations ought to be independent from—in other words, free from domination by—those with whom their members bargain; they ought to be inclusive (i.e., prohibited from discriminating on the basis of race, sex, sexual orientation, gender identity, national origin, disability, religion, or other protected status); their leaders ought to operate under basic fiduciary duties to their members, with obligations of financial disclosure; and organizations ought to be required to maintain democratic governance structures. These requirements are consistent with good-governance guidelines generally. They also may help facilitate the organizational strength of social movements over time by minimizing “oligarchization, co-optation, and the dissolution of indigenous support.” McAdam, supra note 41, at 36. At the same time, it is essential that duties imposed by law not work to defeat the very purpose of a law of organizing: to enable poor and working-class individuals to form organizations that can exercise effective political power. Cf. Estlund, supra note 153, at 225-28 (describing restrictions on labor picketing as indefensible under a quid pro quo analysis).}
fundamentally weaken their power while strengthening countervailing forces. The point is well taken. Reforms suggested in this Article will be difficult to achieve, particularly at the national level in the short term.

Yet the obstacles are not insurmountable. The power of the wealthy ebbs depending on circumstance and alignments, and several factors can enable economically progressive legislative change. First, government tends to respond to the concerns of poor and working-class voters when those concerns become particularly salient. Second, divisions among elites can create openings for redistributive reform, as can elite sympathy with the cause of less affluent fellow citizens—or worry that failure to act will produce even more radical change. In addition, the federalized nature of our government creates openings for legislative change at the state and local level that can, in turn, increase the likelihood of reform at the national level. Crucially, moreover, the growth facilitated by supportive laws in one locality can enable federated organizations to export their power to other localities and ultimately to the national level.

There is reason to believe that several of these dynamics are present today. To state the obvious, the COVID-19 pandemic has made the economic plight of poor and working-class Americans highly politically salient. The resurgence of organizing among workers, tenants, and debtors that has occurred in response to the pandemic—and that has highlighted the inequities of how the pain of the pandemic is distributed—has only increased this salience, as have the extraordinary protests organized by Movement for Black Lives. Voters are clearly

concerned about these issues and increasingly support bold policy initiatives to address them. For example, a huge majority of voters now say they would prefer the federal government take “major, sweeping action”—rather than “modest action”—to address the economic impact of the pandemic.390 There is also strong support for the proposition that “[t]he devastation triggered by coronavirus means we have to both address the immediate economic needs and work to fix problems in our economy—like inequality and poverty—that made us all more vulnerable.”391

These trends extend political shifts that have been developing since the recession of 2008. Thus, majorities in both red and blue states now express support for minimum wage increases and for labor unions.392 Elite opinion shows

similar changes: economists, once largely skeptical of both worker-organization and minimum-wage laws, are now increasingly expressing support. From Medicare for All to a $15 minimum wage, from student-debt relief to fundamental labor-law reform, redistributive policies are being seriously discussed by national political leaders in a way they have not been for at least a generation.

This shift in opinion is already reflected in policy changes in progressive state and local jurisdictions. In California, for example, the governor has extended union-negotiated terms to the entire grocery industry to ensure that safety and health standards reach all the grocery workers in the state. It is safe to say that such a move, with its suggestion of European-style tripartite sectoral bargaining, would have been unthinkable a short time ago. In fact, numerous progressive reforms—ranging from new rights for workers excluded from federal labor law to enhanced protections for tenants—have been enacted at the state and local level in jurisdictions with progressive majorities and active organizations among low- and middle-income residents. The extent to which experimentation at the local level is legally permissible will vary based on the organizing context. In some cases, like labor law, significant federal-preemption hurdles exist. In other areas, like tenant rights, preemption is not an obstacle. But in both contexts, and in others as well, some local and state experimentation is both possible and imperative, laying the groundwork for future federal reform.

Of course, once legislative majorities exist, backlash is a concern, as is conservative judicial resistance. Particularly in recent years, where progressive localities have engaged in innovative economic policymaking, conservative states have clamped down through aggressive preemption rules and courts have a
long history of interpreting ambiguity in law against the interests of the poor and working class. To some extent, legislation can be designed with this history in mind—for example, through the inclusion of clear purpose statements, unambiguous text, and provisions that limit courts’ injunctive power. And with respect to political backlash, as E. E. Schattschneider famously argued, “New policies create a new politics.” That observation will have particular relevance in our context. After all, laws designed to enable organizing will be particularly effective at generating their own political durability precisely because they will—explicitly and intentionally—build constituencies with the power to ensure the laws’ survival.

None of this is to suggest that enacting laws to facilitate organizing among the poor and middle class would be easy; none of it is to predict that such enactment would be likely. Of course, the kinds of laws we propose here would face intense opposition. Those who currently wield unrivaled power will vigorously object to laws that enable their power to be countervailed. Those who have had disproportionate—sometimes unfettered— influence over our politics will object to the diminishment of that influence. But, in a democracy, these objections must be overcome. And that is exactly what the reforms we propose are meant to enable.
